## **ABSTRACT**

### **TAXONOMIC STUDIES ON THE GENUS *SALVIA* L. (LABIATAE) IN CENTRAL ANATOLIA, TURKEY**

**SAFI BAGHERPOUR**

**Ph.D., Department of Biological Sciences**

**Supervisor: Prof. Dr. Musa Doğan**

**June 2010, 203 pages**

This research study is a revision of the genus *Salvia* (Labiatae) in Central Anatolia. The author has carried out extensive research studies conducted in a 3 year period starting from June 2005 by collecting specimens from all the localities in Central Anatolia, Turkey. Specimens collected from Turkey by the other researchers and kept either in Turkey or abroad were also examined.

The samples were studied using their root, stem and leaf morphology including essential characteristics of flowers. Using this information dendograms were obtained and taxa cut off lines were drawn. The cross sectional preparations of stem and leaf were observed for taxonomical evaluation. *Salvia* taxa leaf surface, flower organs and seed surface were studied for understanding the diagnostic value of their micro morphological characteristics. Anatomical sections of the specimens were analyzed under light microscope and the data was used for further taxa separations.

The *Salvia* species were further investigated for their pollen characteristics such as surface view and dimensions. Numeric taxonomic methods were used for constructing a natural infrageneric grouping in the genus as far as the species allows. Using software and computer grouping each sample was ranked and placed into specific taxa.

First the samples were identified by using the species key given in Turkish Flora. According to the Turkish Flora there were two ways to identify samples. One way based on the stamen features and the other based on the leaves and flowers. For nomenclatural reasons the specimens were cross checked with the existing type specimens known from Turkey and kept in some international herbaria.

This thesis is formed by two sections. The first section is comprised of introduction, materials and methods and basic findings. Basic finding are the result of morphological, anatomical, palynological and ecological investigations. In the second section of the thesis, a revision of *Salvia* in Central Anatolia, Turkey is given. This includes results of numeric studies and infrageneric grouping.

Soil types and habitat characteristics were also studied. Soil samples were taken from the various locations and analyzed for their content. The populations were revisited to determine the sustainability and vulnerability of each taxon. IUCN threat categories were determined based on habitat information and species limitations. The phenological data and relevant field observations were all recorded.

In Central Anatolia 43 *Salvia* species were found. Among the specimens collected from the area one taxon was re-discovered after 116 years.

Key Words: Labiateae, *Salvia*, Revision, Turkey.

## ÖZ

### **İÇ ANADOLU BÖLGESİ'NDE BULUNAN SALVIA L. TÜRLERİNİN TAKSONOMİK ÇALIŞMALARI**

**SAFI BAGHERPOUR**

**Doktora, Bioloji Bölümü**

**Tez Yöneticisi: Prof. Dr. Musa Doğan**

**Haziran 2010, 203 sayfa**

Bu araştırmada, İç Anadolu'da yayılış gösteren *Salvia* (Labiatae) cinsinin revizyonu yapılmıştır. Yazar, Haziran 2005 tarihinden başlayarak 3 yıl süreyle İç Anadolu'daki tüm lokalitelerden numuneler toplayarak kapsamlı araştırmalar gerçekleştirmiştir. Ayrıca, başka araştırcılar tarafından Türkiye'den toplanan ve Türkiye yada yurtdışında tutulan örnekler de incelenmiştir.

Örnekler kök, gövde ve yaprak morfolojisi ile çiçek temel özelliklerini kullanılarak çalışılmıştır. Bu bulgular kullanılarak dendogramlar elde edilmiş ve taksonların kesim hatları çizilmiştir. Taksonomik değerlendirme için gövde ve yaprak anatomi kesitlerine bakılmıştır. Mikromorfolojik karakterlerin ayırcı ozelliklerini anlamak için, *Salvia* taksonlarının yaprak yüzeyleri, çiçek organları ve tohum yüzeyleri çalışılmıştır. Örneklerle ilişkin anatomi kesitler, ışık mikroskopu altında incelenmiş ve elde edilen veriler taksonların birbirinden ayrılmıştır.

Çalışılan türlerin polen özellikleri ve yüzey mikromorfolojileri ayrıntılı olarak çalışılmıştır. Belirlenmiş türler kullanılarak cinsiçi doğal sınıflandırmanın yapılabilmesi için numerik taksonomik metodlar kullanılmıştır. Her bir örnek bilgisayar ve yazılım kullanılarak özel bir takson olarak atanmıştır.

Öncelikle, örnekler, Türkiye Florasında verilen tür anahtarları kullanılarak teşhis edilmiştir. Türkiye Florasına göre örneklerin tespit edilmesi için iki yol vardır. Bu yollardan biri stamen özelliklerine, diğer ise yaprak ve çiçek özelliklerine dayalıdır. Nomenklatürel nedenler ile örnekler, Türkiye 'den bilinen ve bazı uluslararası herbaryumlardaki mevcut tip örnekleri ile kıyaslanmıştır.

Bu tez iki bölümden oluşmaktadır. Birinci bölüm giriş, materyal ve yöntemler ile temel bulguları içerir. Temel bulgular morfolojik, anatomik, palinolojik ve ekolojik araştırmaların sonucudur. Tezin ikinci bölümünde İç Anadolu'daki *Salvia* cinsinin revizyonu verilmektedir. Bu da numerik taksonomi ve cinsiçi gruplamanın sonuçlarını içermektedir.

Toprak tipleri ve habitat özellikleride incelenmiştir. Toprak örnekleri çeşitli lokalitelerden alınmış ve bunların içeriği analiz edilmiştir. Popülasyonlar her bir taksonun sürdürülebilirlik ve duyarlığını belirlemek için tekrar ziyaret edilmiştir. Habitat bilgilerine ve tür limitlerine dayalı olarak IUCN tehlike kategorileri belirlenmiştir. Fenolojik veriler ve bilimsel arazi gözlemlerinin tümü kaydedilmiştir.

İç Anadolu'da 43 *Salvia* türü belirlenmiştir. Bu bölgeden toplanan örneklerin arasında bir takson 116 yıl sonra yeniden toplanmıştır.

Anahtar Kelimeler: Labiateae, *Salvia*, Revizyon, Türkiye.

To my wife Dawn and my three sons: Daniel, Michael and Andrew.

## **ACKNOWLEDGMENTS**

I would like to thank my supervisor Prof. Dr. Musa Doğan for his guidance and professionalism. I appreciate the time he invested in this study and thesis. I especially enjoyed our field research trips.

I also would like to thank my thesis jury and my thesis committee for their suggestions and constructive criticism.

I appreciate my co-workers for keeping this “yaramaz yabancıl” out of trouble. Ferhat Celep, Ahmet Kahraman, Evren Cabi and Ozlem Mavi.

I also respectfully acknowledge The Scientific and Technical Research Council of Turkey (TUBITAK – TBAG – 104 T 450) for their financial assistance and also the Curators of the following Herbaria: AEF, ANK, B, BM, E, G, GAZI, HUB, ISTE, ISTF, K, KNYA and W for their assistance in the study of their specimens.

Because Prof. Dr. Gönül Tankut inspired me to continue my education at METU a new subspecies is named in her honour.

Most of all my wife deserves credit for taking care of our sons during my summer research trips.

# **CHAPTER 1**

## **INTRODUCTION**

### **1.1 Historical background**

CIVILIZATION rose to two great heights in Southwest Asia, namely in the Bronze Age and in the later Classical period. In the latter medicine advanced considerably and culminated in the work of Hippocrates. Knowledge of medicine in the Greek Bronze age depended on the study of Homer until this century, when work in the fields of archaeology and philology provided more facts. This work has shown that this early Greek medicine had much in common with that of its contemporary Near Eastern civilizations. During this period medicine was taken to a much higher level than that practiced in Egypt. Discovery of tablets from this period indicate a long list of plants. The plants were named in palace records and were described by dry volume and weight. The following plant names have been identified on the tablets: celery, coriander, cumin, cyperus grass, fennel, figs, garden grass, ginger grass, iris root, linseed, mint, pennyroyal, rose, safflower, sage and sesame. The mention of sage in this list emphasizes the importance of it as far as 1500 B.C. (Warren, 1970).

The genus *Salvia* (sage) has been an important medicinal plant since earliest times. This is an herb that has the reputation as one which wards off evil. It was thought to be efficacious against the biting of serpents and the dispelling of evil spirits [Ceres, 1984]. It was employed in ancient Egypt to increase the fertility of women [Schauenberg and

Paris, 1990]. Theophrastus records two taxa of *Salvia*, one a spineless wild under shrub whose name he gives as Joakos (sphakos), the other resembling it, but cultivated, called (elelisphakos) [Theophrastus]. Pliny says that elelisphakos called *Salvia* by the Romans, is a mint-like, hoary and aromatic plant. It was cultivated more than sphakos of Theophrastus, and was used as a diuretic, for promoting menstruation, as a local anesthetic (numbing the surface of the skin where it is applied), and when taken in drink with wormwood, a treatment for dysentery [Pliny]. Monastery gardens in the time of the Carolingian empire of the early Middle Ages were cultivating the plant. Walahfrid Strabao, in his Hortulus, describes it as having a sweet scent and being of proved value in many human ailments. He goes back to the Greek root for the name he gives it, Lelifagus [Strabao]. There can be little doubt that, from the time of Theophrastus and Pliny on, the *salvia* cultivated under these different names is *Salvia officinalis* (Dweck, 2000).

More recent scientists site *Salvia* species as being used in medicines all around the world, possessing antibacterial, antioxidant, antidiabetic and antitumor properties (Senol et al., 2010; Ulubelen, 2003). In addition, many *Salvia* species are used as herbal tea and food flavoring, as well as in cosmetics, perfumery and the pharmaceutical industry (Demirci et al., 2003). They are also grown in parks and gardens as ornamental plants (Nakipoğlu, 1993).

Anatolia is a major center for the genus in Asia. Some species are native to the Mediterranean region while also cultivated all over the world. Dried leaves and flowers are used as a culinary spice for flavoring and seasoning and tea. In Western countries, essential oils from some species are used for the treatment of various diseases. The name *Salvia* came from the Latin word meaning “to save” or “to heal.” A few centuries ago, it was nearly always at the top of the list of household remedies for the relief of itching, the lowering of fevers, and the relief of nervous headaches. Extracts and essential oil have been used to treat digestive disorders and to control excessive sweating (Duke, 1985). Additionally some extract are reported to be strong antioxidant (Chang et al.,

1977). The chemical components of *Salvia* species are very complex. Flavonoids from *Salvia* are useful for taxonomy (Nakipoğlu, 2002).

Turkey is an exporter of *Salvia* (*Salvia fruticosa*) leaves. *Salvia* is collected from the wild in western Turkey, dried and exported. There is also a sizeable internal market for *Salvia* leaves, since they are used as herbal tea in western and southern provinces of Turkey. *Salvia* leaf exports of Turkey (kg/US\$/unit value in dollars) are as follows:

**Table 1.1.** *Salvia* leaf export (Baser, 2000). kg/US\$/unit value in dollars.

1991	1992	1993	1994	1995	1996
508.646	563.863	576.257	400.220	547.821	681.044
1,096.145	1,118.746	1,367.658	837.511	1,121.261	1,476.674
2.160	1.980	2.370	2.090	2.050	2.170

In Turkey, *Salvia* oil is produced from *S. fruticosa* (wild) in Manisa and Alanya by steam distillation using commercial stills. The oil also known as elma yagi (apple oil) is obtained using cottage-type stills in South-Aegean parts of Turkey. In some districts, the plant is locally known as “elma” (apple) due to the resemblance of galls growing on its leaves and stems to small apples. *Salvia* oil is locally used medicinally as herbal oil. Annual production is an estimated 500 kg (Baser, 1994).

## 1.2 Literature review

Lamiaceae or Labiateae, also known as the mint family, is a family of plants comprising about 210 genera and some 3,500 species. The plants are frequently aromatic in all parts and include many widely used culinary herbs, such as basil, mint, rosemary, *Salvia*, savory, marjoram, oregano, thyme, lavender, and perilla. Some are shrubs, but rarely trees or vines. The original family name is Labiateae, so given because the flowers typically have petals fused into an upper lip and a lower lip. Although this is still considered an acceptable alternate name, most botanists now use the name "Lamiaceae" in referring to this family.

Briquet's (1895-1897) classification of Labiatae, currently the most widely used system for the family, was heavily influenced by and has largely displaced Bentham's (1876) classification, with which it differs mainly in ranking and interrelationship of suprageneric groups rather than the content of those groups (Table 1.2). Briquet's most significant alteration of Bentham's system was the merging of four tribes Lamieae, Nepeteae, Salviaeae and Mentheae in one subfamily Lamioideae which should not have been made. Briquet's transfer of *Rosmarinus* from Bentham's Salviaeae to his own Ajugoideae was a mistake; *Rosmarinus* has hexocolpate pollen and was thus better placed in Salviaeae. Bentham's classification is highly congruent with Erdtman's subfamilial system. By and large, Bentham's tribe Ajugeae, Prostantheroideae, Prasieae, and Lamieae correspond to Erdtman's Subfam. Lamioideae, while Bentham's other four tribes correspond to subfam. Nepetoideae. The most recent and the best classification (Erdtman, 1945) includes subfamily Nepetoideae which comprises the taxa of *Salvia* (Cantino, 1986).

**Table 1.2.** Comparison of classification of Bentham (1876), Briquet (1895-1897), and Erdtman (1945).

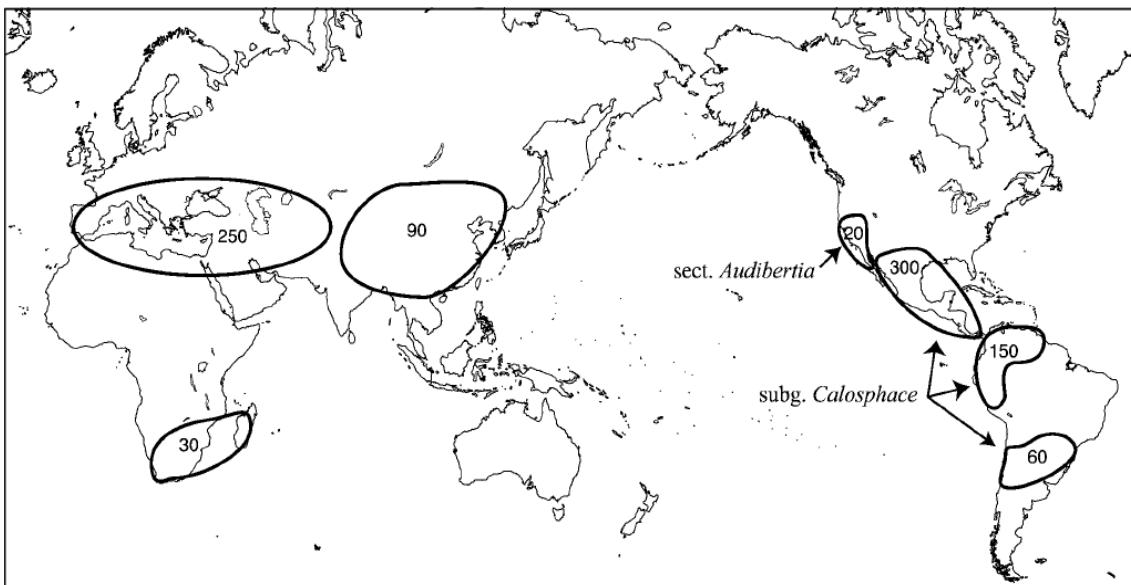

Bentham	Briquet	Erdtman
Tribe Ajugeae	Subfam. Ajugoideae(including <i>Rosmarinus</i> )	Subfam. Lamioideae
Tribe prostantheroideae	Subfam. prostantheroideae	
Tribe prasieae	Subfam. Prasioideae	
Tribe Lamieae	Subfam. Lamioideae	
Tribe Nepeteae		Subfam. Nepetoideae
Tribe Salviaeae(including <i>Rosmarinus</i> )		
Tribe Mentheae		
Tribe Ocimeae	Subfam. Ocimoideae (including Subfam. Lavanduloideae and Subfam. Catopherioideae)	

*Salvia* L. belongs to the subfamily Nepetoideae within the Labiatae, a monophyletic group well supported by both molecular and morphological data (Claben-Bockhoff *et al.* 2004). *Salvia* is a fascinating plant genus. One of the widest-spread members of the Labiatae family. The genus *Salvia* represents an enormous and cosmopolitan assemblage

of nearly 1000 species displaying a remarkable range of variation. *Salvia* has undergone marked species radiations in three regions of the world: Central and South America (500 spp.), Central Asia/Mediterranean (250 spp.), and eastern Asia (90 spp.) Bentham's (1848) study of *Salvia* separated the genus into 12 sections and remains the most widely accepted treatment of *Salvia* (Walker, 2004).

According to the most recent edition of the Turkish Flora there are 86 *Salvia* species in Turkey (Hedge 1982a) and later the number of species was raised to 89 (Davis et al., 1988; Guner, 2000; Vural & Adiguzel, 1996; Dönmez, 2001). About 50% of the species residents of Central Anatolia and of these 26 are endemic to this area. The distribution in neighboring countries or "Flora areas" is as follows: 75 species in the former USSR (Pobedimova, 1954), 70 in the *Flora Iranica* (Hedge, 1982b), 36 in Europe (Hedge, 1972).

It is assumed that *Salvia* originated in the Old World, from an ancient Mediterranean ancestral species. Member species might have migrated during the Miocene and Pliocene via tropical mountains to South America and South Africa. Fossils from Mexico and Alaska date from the Lower and Upper Miocene and thus indicate an age of at least 25 million years (Claben-Bockhoff et. al., 2004). There are seven important distribution areas for the genus in the world (Map 1.1). Anatolia is a major centre for *Salvia* in Asia.

**Map 1.1.** *Salvia* distribution worldwide.

Taxonomy of *Salvia* at the present time has many inconsistencies. It is becoming increasingly difficult to recognize above species groups from each other (according to the most recent edition of the flora of Turkey, Hedge, 1982a). Because of the interest in the medicinal activity of this genus to date the majority of the research is directed toward this area (Ulubelen A., 2003). Therefore, what gives importance to *Salvia* has distracted many from directing research into the most important aspect of any plant and that is its proper taxonomy. Additionally there are inconsistencies in literature about the total number of species and their rate of endemism. At the present time there are no sectional divisions prepared for *Salvia* in Turkey.

Therefore, we prepare a more detailed taxonomic study based both on morphology and micro-morphology. The aim of this project is to produce a complete revision of the genus *Salvia* in Central Anatolia, Turkey.

Boissier (1875), in his *Flora Orientalis*, recognized 107 species of *Salvia*; some of which were either described or recorded from Turkey. He placed these species under seven sections, which had been all recognized previously by Bentham (1833). These sections are as follows: *Eusphace*, *Hymenosphace*, *Drymosphace*, *Aethiopsis*, *Plethiosphace*, *Horminum* and *Hemisphace*. Section *Eusphace* was later designated as

the type section of the genus *Salvia* (Hedge, 1972; Reales *et al.*, 2004). Section *Drymosphace* Benth is absent in the Central Anatolia.

The first revision of *Salvia* L. in Turkey was made by Hedge (1982a) in *Flora of Turkey and the East Aegean Islands* vol. 7. Additional to the same were supplements 10 (Davis *et al.*, 1988) and 11 (Guner *et al.*, 2000) in which 88 species in total were recognized. Since the publication of the flora and the supplements, 5 more new taxa, *S. hedgeana* (Dönmez, 2001) and *S. anatolica* (Hamzaoğlu & Duran, 2005), *S. marashica* (İlçim *et al.*, 2009), *S. ekimiana* (Celep & Doğan, 2009) and *S. sericeotomentosa* (Celep *et. al.*, 2009), and 3 new records, namely *S. macrosiphon* Boiss. (Kahraman *et al.*, 2009) and *S. aristata* Aucher ex Benth. (Behçet & Avlamaz, 2009) and *Salvia viscosa* Jacq. (Celep *et al.*, 2009) have been recorded. The total at present is 95 species.

### 1.3 The study area

There are three major phytogeographical regions in Turkey: Euro-Siberian, Mediterranean and Irano-Turanian. Central Anatolia, part of the Irano-Turanian phytogeographical region is the most isolated section of Turkey. It contains over 50% of the endemic taxa of *Salvia* in Turkey. This region stretches inland from the Aegean; it occupies the area between the two zones of folded mountains: the Sultan and the Sundukan mountains on the west-northwest and the Taurus Mountains on the south. It extends east to the point where the two mountain ranges converge. The Central Anatolian region occupies 19% of the total area of Turkey with its 151.000 square kilometers of land; it's the second largest region of Turkey after Eastern Anatolia.

The plateau-like, arid highlands of Anatolia are considered the heartland of the country. The region varies in altitude from 300 to 3,900 meters west to east, predominately about 900 meters in elevation. The two largest vegetational areas are the peripheral areas of deciduous scrubs which represents the originally forested areas and the treeless basin occupied by Tuz Gölü (Salt Lake). This unique region of the Central Anatolian basin is

composed of salt steppe, saline lakes and halophytic vegetation as well as marshes, rivers and freshwater bodies (Davis, 1965).

This study was conducted in Central Anatolia, Turkey where the most abundant gypsum areas are present. Gypsum areas occupy 0.5% of Turkey. The largest fraction of gypsum is present within the Sivas province. The rate of endemism in the Sivas area is high due to the presence of gypsum habitats. The chief advantage of gypsum for *Salvia* is perhaps reduced moisture stress during the early summer drought. This is due either to reduced competition for water because of low densities or to intrinsic properties of the gypsum soil (Akpulat, 2005). Habitat and soil development are also dependent on temperature and precipitation, both of which require long-term study (Doğan, 2003). Such studies have been done by many authors (Akman and Ketenoglu, 1976; Cetik, 1985; Ketenoglu et al., 1983, 1996, 2000). The northern part of the Central Anatolia area is well studied by Doğan(2003) and he finds the northern part as receiving lower amount of precipitation than the southern area, but since the area has colder climate it has lower annual actual evaporation. The most critical period suggested by Doğan (2003) for the studied area was during the month of May and September. During this period evaporation exceeds precipitation resulting in critical water deficiencies.

For ecological studies, soil samples were taken from suitable habitats of *Salvia*. All soil samples were analyzed at the Soil, Fertilizer and Water Resources Central Research Institute, Ankara. Soil texture, organic matter, total salt, pH, CaCO<sub>3</sub>, P and K analysis were made using standard techniques (Bayraklı, 1987) and the results have been evaluated according to Kaçar (1972).

## **1.4 Objectives and Scope of the study**

The objectives of this study were to:

- a) To collect all of *Salvia* taxa growing in Central Anatolia so as to prepare a taxonomic revision of it.
- b) To classify the *Salvia* species by means of using numeric taxonomic methods.
- c) To study ecological preferences of the taxa.
- d) To determine the conservation status of *Salvia* taxa on the basis of IUCN threat categories.
- e) To understand morphological, palynological, phytogeographical and anatomical diagnostic characteristic of the taxa.
- f) To determine significance of the micro-morphological properties of pollens.
- g) To prepare a revision of *Salvia* found in Central Anatolia.

## **CHAPTER 2**

### **MATERIALS AND METHODS**

#### **2.1 Sampling Methodology**

The Central Anatolia area was divided into grids according to Davis's grid system. The Flora location information was entered into excel file and each grid was identified for its existing species richness. In general, limestone and igneous slopes and or quercus and calcareous rocky areas are preferred by taxa of *Salvia*. Therefore, it was decided to concentrate sampling to these areas and repeat sampling at different times of year. Flowering times of the flora was also incorporated into the sampling plan. Sampling time was began in March and ended in August. During the field trips samples were carefully labeled and numbered. The location information and field identifications were recorded in the field notebook. This included GPS information for each sampling site. Digital photographs were taken to be used later in identifying the specimens. The samples were pressed, dried, brought to the lab, and kept in a safe area (Davis & Heywood, 1973). They were identified using the species key given in the Flora (Hedge, 1982a). According to the Flora there were two ways to identify samples. One was based on stamen features and the other was based mostly on leaves and flowers. They were cross-checked with the *Salvia* accounts of various relevant floras, such as *Flora Orientalis* (Boissier, 1879), *Flora Iranica* (Hedge, 1982b), *Flora of the USSR* (Pobedimova, 1954) and *Flora Europaea* (Hedge, 1972). The samples were also compared with the samples in existing herbaria; Ankara (ANK), Gazi (GAZI) and

Istanbul (ISTE). International collections deposited at the University of California at Riverside, CA, United States and Edinburgh (E) were also consulted.

## 2.2 Morphological and Anatomical Methods

The samples were studied using their stem and leaf morphology including essential characteristics of their flowers and reproductive organs. The cross sectional preparations of stem and leaf were observed for taxonomical evaluation (Metcalfe & Chalk, 1950). The *Salvia* taxa leaf surfaces, flower organs and seed surfaces were studied for their micro morphological characteristics. Using statistical analysis, histograms were prepared and the position of each taxa was determined (Doğan, 1982). Cross sectional specimens were also studied under electron microscope. The *Salvia* species were further investigated for their pollen characteristics such as surface and diameter. Finally numeric taxonomic methods were used for constructing a natural infrageneric grouping in the genus. This includes character selection followed by measurements. Using software and computer grouping each sample was ranked and placed into specific groups (Sneath & Sokal, 1973).

Anatomical studies were carried out on the specimens kept in 70% alcohol. The paraffin method was used for the cross sections of the leaves and stems. The specimens were embedded in paraffin and then sectioned (10-15 um thickness) with a Leica RM2125RT rotary microtome. All sections were stained with safranin-fast green and mounted with entellan. Measurements and photos were taken using a Leica DM1000 binocular light microscope with a Leica DFC280 camera.

Nutlets were first examined using a Leica S8AP0 stereomicroscope to ensure that they were of normal size and maturity. In order to determine the average seed sizes, mature nutlets were measured. For SEM, the mature nutlets were placed on stubs directly and covered with gold. After that, they were observed and photographed with a JEOL JSM-6400 scanning electron microscope (Dogan 1988).

### **2.3 Palynological Methods**

Pollen materials were obtained from plant specimens collected in the field during the flowering time in the years 2005, 2006, 2007, 2008. Pollen grains for examination by LM were prepared according to the Wodehouse (1935) method. Pollen grains were dissected from herbarium specimens and placed on a clean microscope slide. Two to three drops of 96% ethanol were added to melt the resin and oil. Glycerin-jelly with basic fuchsine was placed on pollen grains and allowed to melt. The pollen grains and jelly were mixed by a clean pin to get scattered pollen grains. The pollen grains were photographed from a permanent slide with an Olympus BX51 camera. All measurements were determined on thirty pollen grains. The terminology of the exine sculpturing and structure follows mainly that of Henderson et al. (1968), Faegri–Iversen (1984) and Punt et al. (2007).

Pollen slides for morphologic examination by light microscopy were prepared (Wodehouse, 1935) and the measurements were made with a Leica DM1000 microscope. The measurements corresponding to the polar length (P) and equatorial length (E) of pollen grains were taken, and P/E ratios were calculated. Colpus length, exine thickness and intine thickness were measured. For studying pollen ornamentation, dry pollen grains were first mounted on double-sided carbon tape affixed to aluminum stubs. Grains were coated with gold using a Bio-Rad Polaron Division coating system and observations were made using a Jeol JSM-6490LV Scanning Electron Microscope (SEM) at the Turkish Petroleum Corporation (TPAO). SEM images were used to describe surface texture of the pollen, the calyx, inflorescence indumentum and nutlet. The descriptive terminology of Faegri and Iverson (1975) was followed.

For SEM studies, pollen grains were transferred directly to a stub with double-sided tape and micrographs were obtained using Jeol-6060 SEM (at Gazi University) and Jeol JSM-6400 SEM (at Middle East Technical University), at an accelerating voltage of 20 KV. The measurements on the base of SEM photomicrographs were recorded.

## **2.4 Methods used for Numeric Taxonomy**

There were at least five steps in phonetic classification that results in numeric taxonomy (Stuessy, 1990). The first step was the selection of operational taxonomic units (OTU), followed by the selection of characters. Measurements and /or description of character states were made on the herbarium specimens. The data obtained from the herbarium materials were averaged and tabulated. The data matrix resulting from the morphometric study, composed by 41 rows (species) and 53 columns (characters) (Table 4.2), was constructed prior to multivariate analyses. Multiple correspondence analyses were used to obtain a single phenogram, applying UPGMA (the unweighted pair-group method using arithmetic averages) algorithm and the Gower General Similarity Coefficient. A similarity matrix was created first, using the Gower General Similarity Coefficient which can handle binary, multistate, and quantitative data equally well (Sneath and Sokal, 1973). These similarity values were then clustered by UPGMA and the results are shown in the phenogram. UPGMA is the most frequently used clustering method (Rosemburg, 1984) and also appears to produce the best results (Radford, 1986). For these analyses, the MVSP (a multivariate statistics package for PC and compatibles) program package for clustering analysis was applied.

## **CHAPTER 3**

### **BASIC FINDINGS**

#### **3.1 Morphological information**

Leaf, calyx and corolla observation and measurement results were recorded (Table 4.2) and used in numeric taxonomy evaluation. Leaves are opposite in all taxa of *Salvia* and vary in shape and size from one part of a plant to another. Because of this variation the most mature and most common forms are used as a general description tool. Due to wide variation in leaf shape, there has been a great deal of taxonomic confusion over the years. The variation in leaf depends on geographical area. Plants growing on the south and western part of Turkey usually have smaller leaves while plants growing on the north and eastern side of Turkey have much bigger leaves. Leaf variations are many, from narrowly oblong leaves of *S. Russellii* and *S. hypargeia* to almost rounded leaves of *S. Candidissima* and *S. cyanescens*. Many taxa of *Salvia* have pinnate leaves. Pinnate leaf taxa are generally endemic to Turkey. Some examples are *S. hedgeana*, *S. wiedemannii*, *S. freyniana*, *S. tchihatcheffii*, *S. heldreichiana* and *S. caespitosa*. Leaf margins are also an important taxonomic characteristic, varying from smooth leaves of *cryptantha* to sharply toothed leaves of *S. virgata*. *S. halophila* has the fleshiest leaf of all *Salvia* taxa. *S. ceratophylla* and *S. longipedicellata* poses the largest leaves.

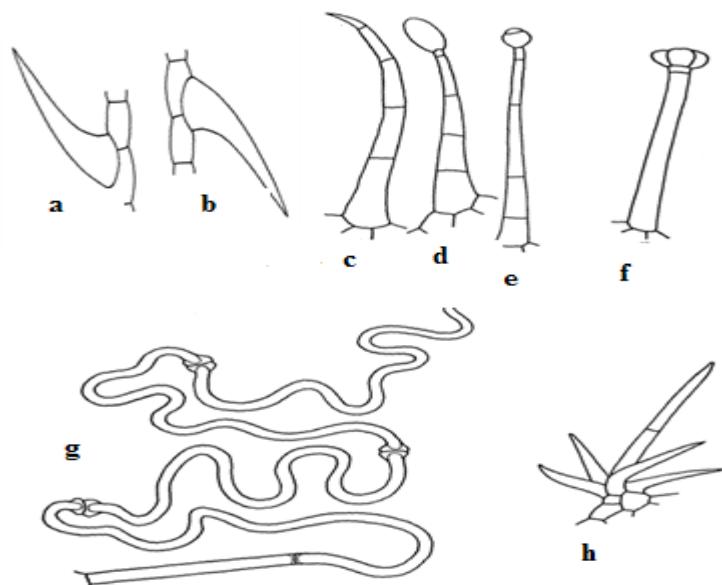

The calyx shape varies considerably from species to species within *Salvia*: tubular, campanulate and infundibular or a combination of these shapes. In Central Anatolia most calyxes are campanulate like: *S. hedgeana*, *S. freyniana*, *S. euphratica*, *S. suffruticosa* and *S. cadmica*. Calyxes are either membranous or none. There are only six taxa of *Salvia* with membranous calyx in Central Anatolia. They include: *S. cadmica*, *S. blepharochlaena*, *S. euphratica*, *S. anatolica*, *S. multicaulis* and *S. cryptantha*.

The calyx is made of two lips (bi-lobate) in *Salvia*. Usually the upper lip is three toothed (tri-dentate) and the lower lip two toothed (bi-dentate). Seldom the upper lips of the calyx are truncate, *S. viridis* and *S. hypargeia*. The upper lip is usually higher than the lower lip. Calyx upper lips of *S. cryptantha* and *S. cadmica* are flat. Calyx variations in *Salvia* are not just due to lips. Other varying points are indumentum and the length of the aristae. Aristae are mostly acuminate (*S. bracteata*, *S. verbenaca* and *S. viridis*), sometimes acute (*S. tomentosa*, *S. aytachii* and *S. divaricata*) and rarely spinosa (*S. yosgadensis*). There are four taxa of *Salvia* with no aristae (*S. cryptantha*, *S. multicaulis*, *S. cadmica* and *S. blepharochlaena*). Additionally there are color variations from green, blue, and purple. Comparison of the calyx to the size of the bract is also significant in taxonomic differentiation.

Like the calyx, the corolla also is bi-lobates and comes in many shapes and colors. The corolla in *Salvia* is composed of five fused petals, two upper lip and three lower lip. The corolla shape and features are very difficult to see in the dried herbarium specimens. Therefore we noted the size and shape of corolla in fresh materials in the field. In some cases the fresh corollas were photographed to record the exact color of the flowers. The corolla shape is mostly described by the upper lip whether it is straight (most taxa of *Salvia*), or falcate like: *S. eriophora*, *S. aethiopis* and *S. modesta*. The tube of corolla is characterised by being squamulate or non-squamulate and the presence or absence of short hairs within the tube as being annulate or non-annulate. Corolla of *Salvia* taxa in Central Anatolia are mostly lilac violet to blue, however pink to white, yellow to yellowish white and cream colored are also noticed. Finally the size of the corolla is a major distinguishing factor in classification. Section *Hymenosphace* all have large corollas.

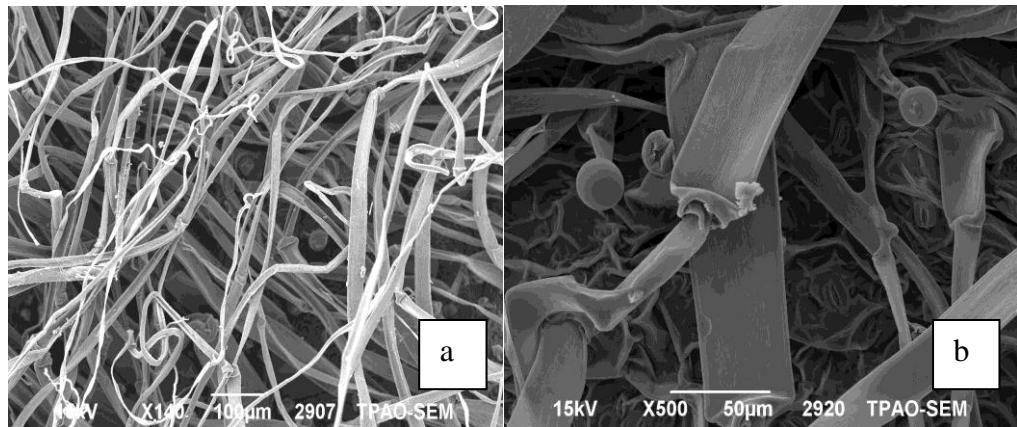

### 3.1.1 Indumentum types

*Salvia* has a variety of indumentum from a density and texture viewpoint (El-Gazzar, 1970). The hair on the surface contributes to the gray color of the *Salvia*. Generally *Salvia* indumentum is divided into two types, glandular (Figure 3.1d,e,f) and eglandular (Figure 3.1a,b,c). Glandular trichomes which can be seen with the naked eye are sticky and yellowish orange in color. The indumentum head is normally multicellular (2-10 celled), however a survey of 127 genera of the Labiateae Cantino (1990) found *Salvia* to have mostly four cells. Other authors have reported up to 12 celled indumentum heads (Kahraman et al., 2010). Species maybe glabrous, sparingly hirsute to densely pilose, or tomentos. In some cases there are varieties of hair types within a species. The eglandular hairs on the stem are often in antrose (Figure 3.1a) or retrose (Figure 3.1b) formation. The dendroid hairs look like stars and cover the surface of some *Salvia* like *S. cryptantha*. The pilose hairs sometimes are formed from many cells or multicellular (Figure 3.1c,d,e) and sometimes from a single cell or unicellular (Figure 3.1f).

**Figure 3.1.** Indumentum types.

The long villous (Figures 3.1g and 3.2a) hair covers the entire leaf or calyx surface of some *Salvia* species however within the same species pilose glandular hairs (Figure 3.2b) can be found.

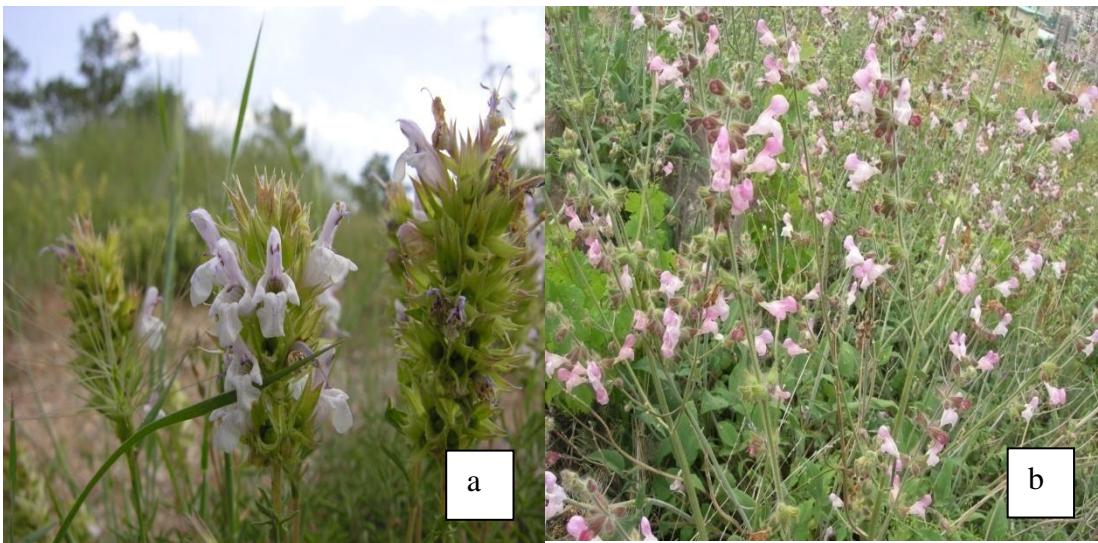

**Figure 3.2.** SEM of Indumentum types: Villous (a), and glandular pilose (b).

### 3.1.2 Inflorescence

The inflorescence varies considerably among *Salvia* species. There are two main types recognized based on branching. However at least three forms of branching were noticed. In Central Anatolia there are 17 racemose (unbranched). Examples of racemose are *S. cadmica*, *S. tchihatcheffii*, *S. cryptantha*, and *S. vermifolia*.

The paniculate (branched) taxa of *Salvia* are mostly candlebriform like *S. aethiopis*, *S. ekimiana* and *S. syriaca*. While the *S. divaricata*, *S. recognita* and *S. nemorosa* are paniculate-cymose.

- Racemose (unbranched); with the flowers arranged densely: *S. tchihatcheffii* (Figure 3.3a )
- Paniculate (branched); forming cymose or candlebriform: *S. recognita* (Figure 3.3b )

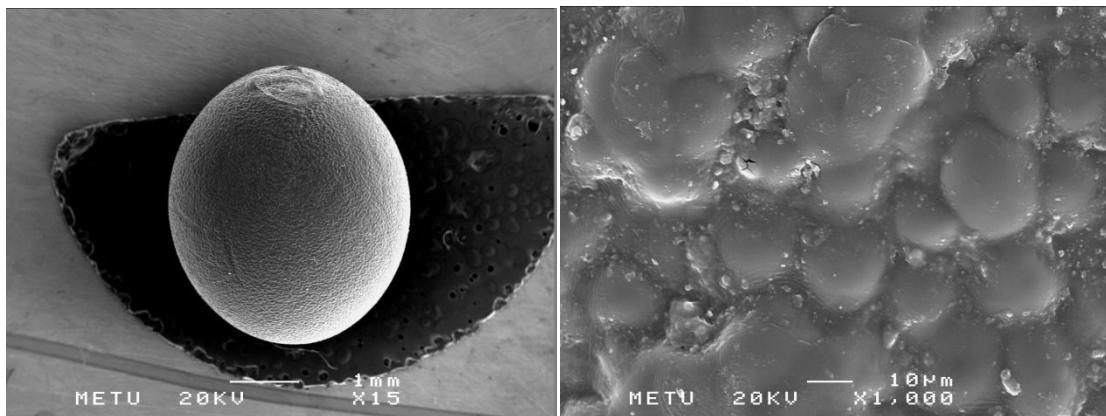

**Figure 3.3.** The racemose inflorescence of *S. tchihatcheffii* (a) and the paniculate inflorescence of *S. recognita* (b).

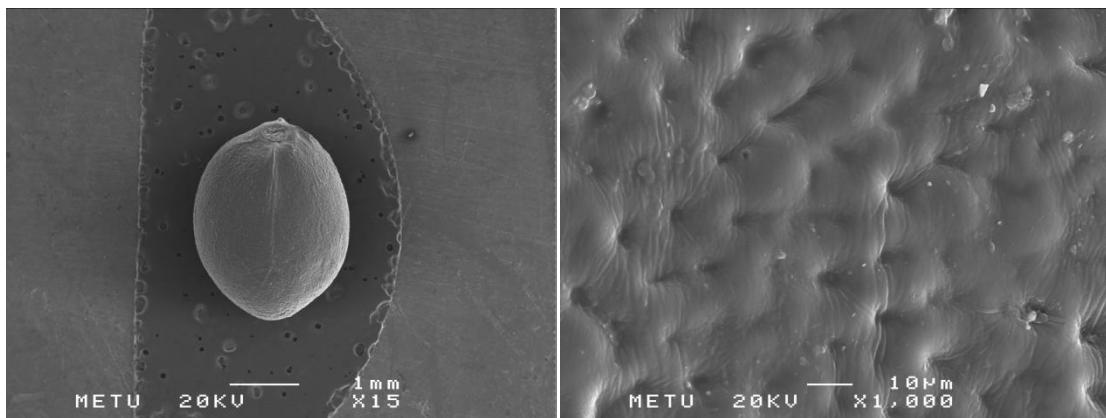

### 3.1.3 Fruit and seed

Nutlet morphology is used in taxa description (Hedge, 1970; Oran, 1996; Kahraman and Doğan, 2009). While the surface sculpturing in *Salvia* species varies as recorded by Oran (1996), there are some common features among them. The fruit of schizocarp divides into four nutlets. The nutlets are ellipsoidal and rounded to somewhat acute at the apex. The seeds are ellipsoidal and flattened longitudinally. At maturity, the seeds contain little or no endosperm. The embryo is straight.

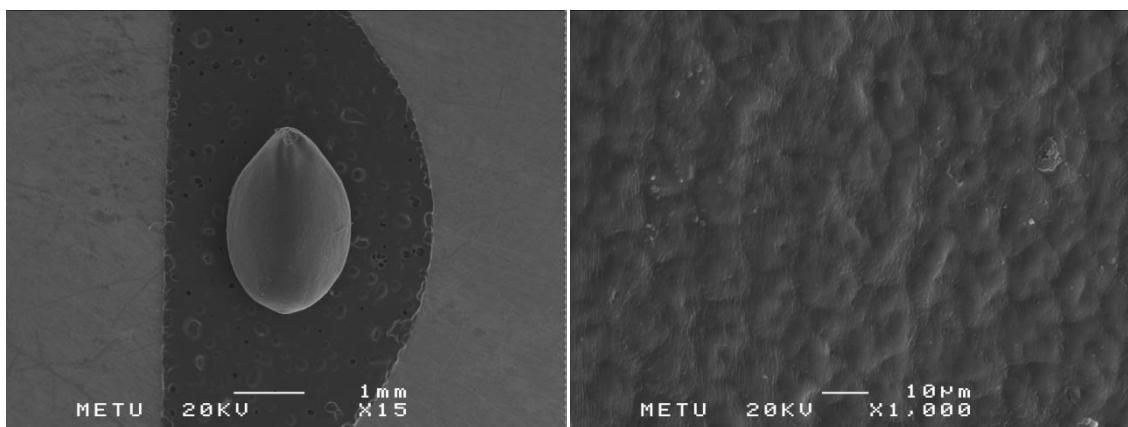

SEM and light microscope were employed to observe the seed surface and other morphological characteristics. The nutlet shape, size and surface sculpturing are the most significant diagnostic characteristics. These observations and measurements are recorded in the infrageneric description of the each *Salvia*. The largest seeds belong to the sect. *Hymenophace* and sect. *Salvia*. The smallest seeds are in sect. *Hemisphace* and sect. *Plethiosphace*. Seed shapes vary from oblong, ovate, spherical, trigonous, suborbicular and ovoid. Observation under 1000x amplification revealed that most *Salvia* seeds are glabrous, however some seeds show, the presence of small hairs. The surface varies from smooth to roughly waved. Below there are SEM photographs of the seeds from the six sections present in the Central Anatolian region: (Figure 3.4 - 3.9).

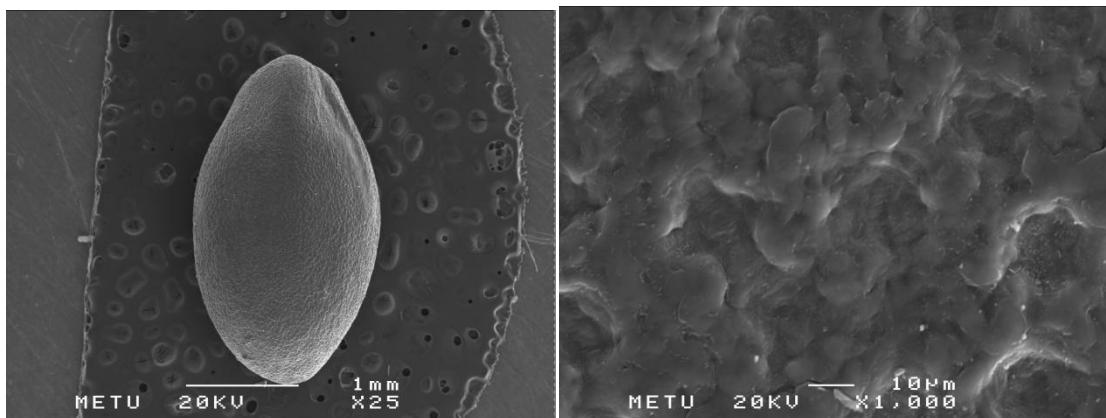

**Figure 3.4.** Nutlet shape and surface sculpturing of *S. euphratica* var. *leiocalycina* (Sect. *Hymenophase*). Nutlets suboblate to rounded trigonous, 4.3-5.4 x 3.5-4.5 mm.

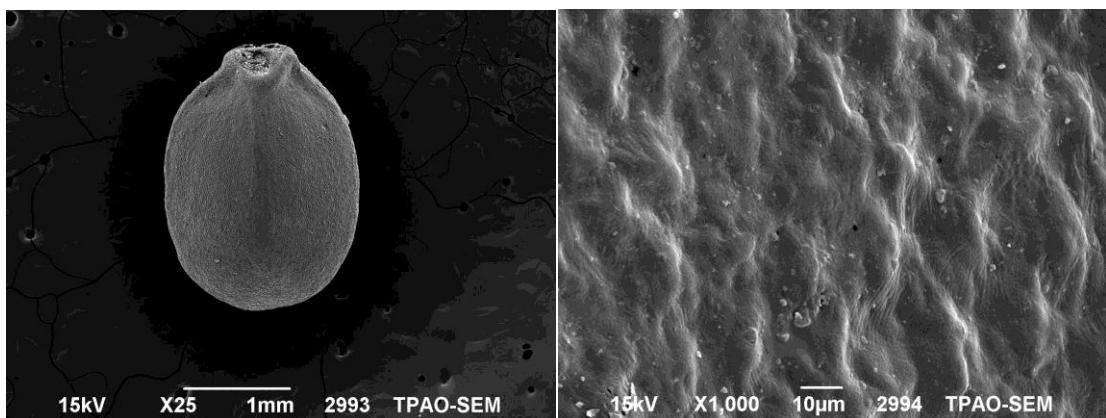

**Figure 3.5.** Nutlet shape and surface sculpturing of *S. freyniana* (Sect. *Salvia*) Nutlets rounded-trigonous and suboblate, 3.1 – 4 x 2.5 - 3 mm, surface slightly tuberculate.

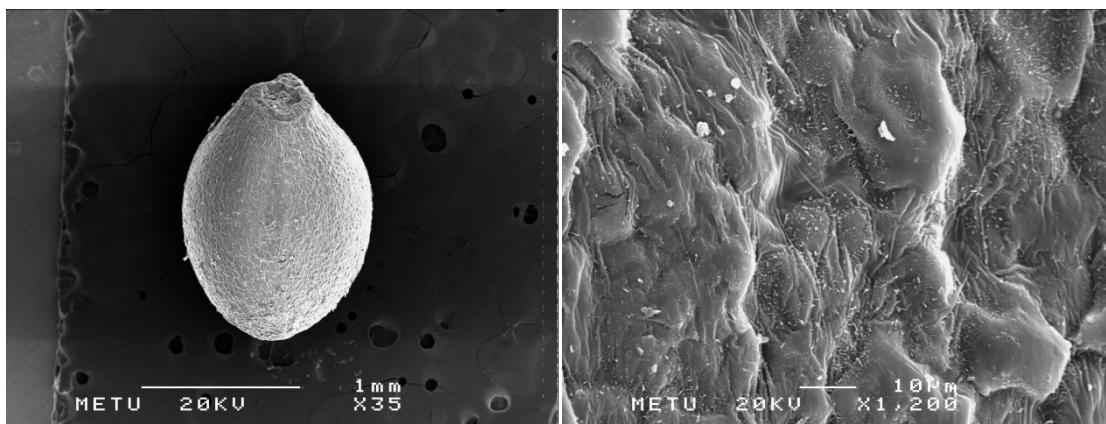

**Figure 3.6.** Nutlet shape and surface sculpturing of *S. aethiopis* (Sect. *Aethiopis*) Nutlets rounded trigonous, ovate 3 x 2 mm.

**Figure 3.7.** Nutlet shape and surface sculpturing of *S. viridis* (Sect. *Horminum*) Nutlets oblong-elliptic, 3 x 1.5 mm.

**Figure 3.8.** Nutlet shape and surface sculpturing of *S. verticillata* (Sect. *Hemisphace*) Nutlets c. 2.2 x 1.3 mm.

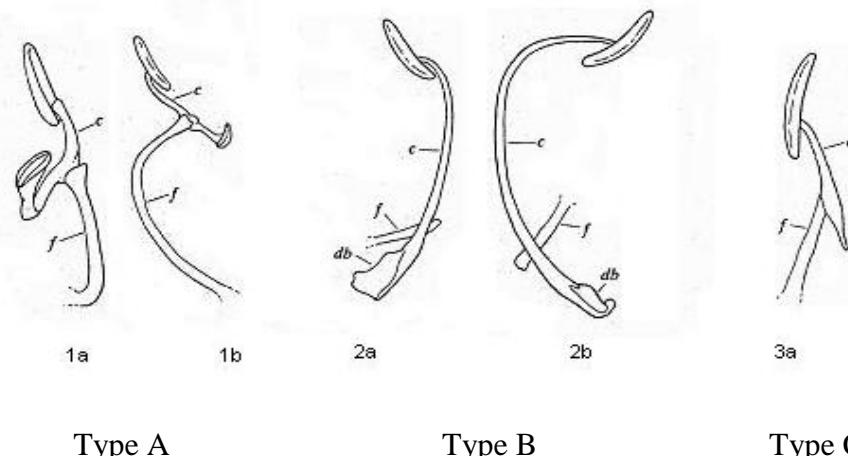

**Figure 3.9.** Nutlet shape and surface sculpturing of *S. nemorosa* (Sect. *Plethiosphace*) Nutlets rounded trigonous, ± ovoid, c. 2 x 1.5 mm.

### 3.1.4 Stamens types

The stamen morphology has figured prominently in infrageneric taxonomy of *Salvia* for a long time (Bentham, 1848; Zalewska, 1928). There are two stamens in *Salvia* and are oriented along the dorsal side of the upper lip of the corolla. The stamens are always epipetalous. The relative length of staminal filaments and corolla tube vary from species to species; thus the filaments may be longer than the tube with the anthers clearly exerted or shorter with the anthers completely hidden within the tube.

There are 3 major types of stamens according to Flora of Turkey (Davis, 1965). Others have reported four (El-Gazzar et all, 1968) and as much as five (Walker, 2004) stamen types in *Salvia*. The three types are indicated in the Figure 3.10. While type A stamens have both their upper and lower theca, the lower theca is sterile. Both type B and C only have the upper theca and the lower theca is absent in type C and reduced in type B. The designations a and b in each stamen type indicates the variations within each type. Of the six sections of *Salvia* found in Central Anatolia, two are type A (Sect. *Salvia*, and Sect. *Hymenosphace*); three are type B (Sect. *Aethiopsis*, Sect. *Plethiosphace*, and Sect. *Horminum*); and one is type C (Sect. *Hemisphace*).

**Figure 3.10.** *Salvia* species stamen types (Hedge, 1982A) f filament, c connective, db dolabriform sterile tissue.

### **3.1.5 Palynology**

The basic shapes of the pollen grains are oblate, spheroidal to prolate (P/E: 0.85-1.09). The outline in polar view is more or less circular while that in equatorial view is circular-ovoid. Pollen grains of the *Salvia* taxa are often hexocolpate: with six equidistant furrows in the exine, radially symmetrical and isopolar. In polar view, two mezocolpia are larger than the other four. Hexocolpate pollen grains have been reported previously in *Salvia* (Trudel & Morton, 1992; Afzal-Rafii, 1983; Henderson et al., 1968)). Colpi are distributed symmetrically and their ends are acute. Colp length (Clg) ranges from 23.95 to 47.33  $\mu\text{m}$  and its membranes are finely or coarsely granular. Mezocolpial area or colpus width (Clt) varies between 3.39 and 8.51  $\mu\text{m}$  (Table 3.1).

**Table 3.1.** Pollen analysis data. Summary of pollen morphological data for the taxa examined (mean value  $\pm$  standard deviation in  $\mu\text{m}$ ). \* indicates endemic to Turkey.

Taxa	Polar axis (P)	Equatorial axis (E)	Colpus Length Clg)	Colpus width (Clt)	Exine thickness	Intine thickness	Apocolpium (t)
<i>S. divaricata</i> *	50.87 $\pm$ 7.08	46.76 $\pm$ 5.30	44.55 $\pm$ 6.84	3.43 $\pm$ 0.93	1.12 $\pm$ 0.12	0.50 $\pm$ 0.03	8.67 $\pm$ 0.48

Table 3.1 shows measurements obtained from the pollen grains in the taxa examined. The largest pollen grains were found in *S. euphratica* var. *euphratica* and *S. candidissima* ssp. *Occidentalis* and the smallest were the *S. russellii*, *S. sclarea*, *S. verticillata* subsp. *amasiaca*, *S. virgata* and *S. vermifolia*.

Pollen morphology of Lamiaceae has been studied by many authors (Erdtman, 1945; Harley et al., 1992; Abu-Asab and Cantino, 1993, 1994; Moon et al., 2008, b; Celenk et al., 2008; Salmaki et al., 2008). The studies reveal that the pollen morphology has proved useful in classification of the family. However, there are only a few investigations focused on pollen morphology of *Salvia* using LM and TEM (Henderson et al., 1968), and SEM (Hamzaoglu et al., 2005; Jafari and Nikian, 2008).

We classified Turkish *Salvia* into two main groups: reticulate as in, *S. bracteata*, *S. divaricata*, *S. aytachii*, *S. tomentosa*, *S. tchihatcheffii*, *S. anatolica*, and *S. recognita* (Figure 3.11) and bireticulate as in, *S. candidissima* subsp. *candidissima*, *S. eriophora*, *S. cyanescens*, *S. candidissima* subsp. *occidentalis*, *S. ceratophylla*, *S. longipedicellata*, *S. verticillata* subsp. *amasiaca*, *S. suffruticosa*, *S. nemorosa*, *S. wiedemannii*, *S. microstegia*, *S. frigida*, *S. russellii*, *S. multicaulis*, *S. cryptantha*, *S. Viridis*, *S. vermifolia*, *S. sclarea*, *S. euphratica* var. *euphratica*, *S. frigida*, *S. caespitosa*, *S. aethiopis*, *S. dichroantha*, *S. hedgeana*, *S. halophila*, *S. yosgadensis*, *S. blepharochlaena*, *S. euphratica* var. *leiocalycina*, *S. virgata*, *S. heldreichiana*, *S. hypargeia*, and *S. cadmica* (Figure 3.12).

**Figure 3.11.** SEM photograph of *S. recognita* pollen.

**Figure 3.12.** SEM photograph of *S. cadmica* pollen.

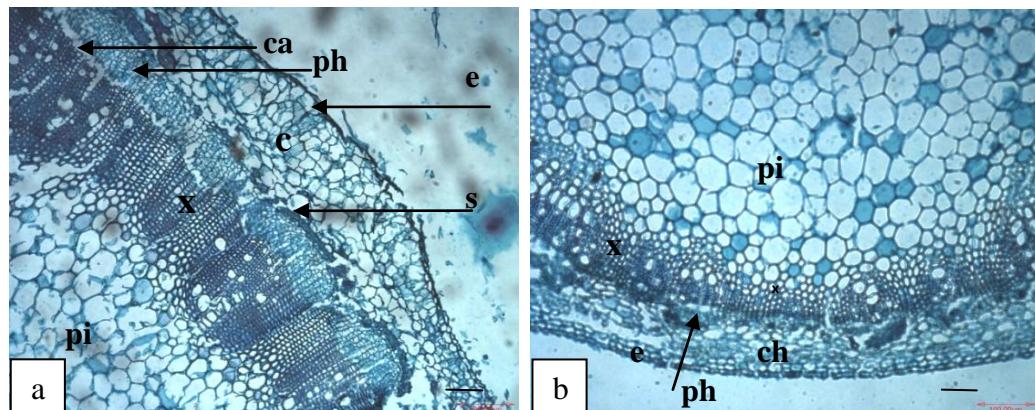

### 3.2 Anatomical information

In addition to vegetative morphological features, vegetative anatomical characters are useful taxonomic tools. Looking inside the stems and leaves serve to refine the relationship among taxa (Stuessy, 1990).

In general the stem transverse section of *Salvia* is quadrangular with the exception of *S. tchihatcheffii* (Aktaş et al. 2009) and *S. divaricata* which are round. *Salvia* stem has a single layer of epidermis, covered with a cuticle. The collenchymatous tissue is present under the epidermis at the corners and consists of oval or rounded cells. Metcalfe and Chalk (1972) also reported a four-cornered stem of *Salvia* containing collenchymatous tissue. The collenchymatous tissue between the corners consists of rounded cells. The cortex constitutes oval parenchymatous cells with intercellular spaces. Vascular bundles

are often separated by parenchymatous cells and those at the corners are larger. The phloem is usually surrounded by 5-10 sclerenchymatous cells or more. Cambium is present between the phloem and xylem elements. The xylem covers a larger region than the phloem. The pith is large and comprises hexagonal or orbicular parenchymatic cells.

The Central Anatolia taxa of *Salvia* studied thus far can be divided into two groups according to their stem epidermis: those with one layered epidermis like, *S. blepharochlaena* (Özkan, 2007), *S. hypargeia* (Kandemir, 2003), *S. sclarea*, *S. virgata*, *S. vermicifolia* (Figure 3. 13a) (Bagherpour, 2010) and *S. viridis* as described by Özdemir et al (2009), and those with two layered epidermis; *S. divaricata*, *S. suffruticosa* and *S. aytachii* (Figure 3. 13b).

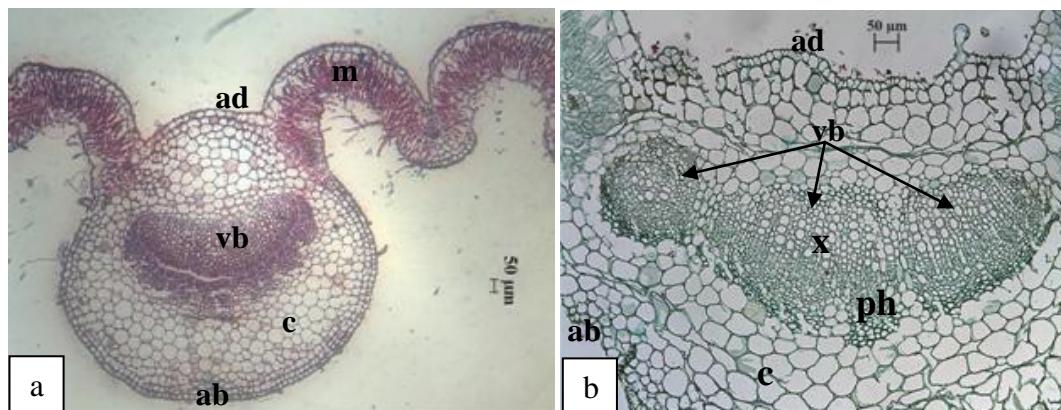

**Figure 3.13.** Stem cross section of *S. vermicifolia* (a), and *S. aytachii* (b).  
 c cortex, ca cambium, ch chlorenchyma, e epidermis, ph phloem, pi pith, s sclerenchymatic cells, x xylem. Bars = 100 um.

The xylem tissue is also used in classification. The Central Anatolia species like; *S. divaricata*, *S. blepharochlaena* as described by Özkan (2007) poses stems with the xylem cell layers very close together and in the *S. hypargeia* (Kandemir, 2003), *S. sclarea* (Özdemir, 1999), *S. virgata*, *S. verbenaca*, and *S. nemorosa* the xylem cell layers are very much apart and separate from each other.

The leaf transverse section of *Salvia* is generally composed of a one-layered (rarely two) epidermis, covered with a cuticle. Both upper and lower epidermal cells consist of uniseriate, oval or rectangular cells. The upper and lower walls of the epidermis cells are thicker than the lateral walls. The stoma cells of varying size and density are present on both sides of the leaf. The midrib region forming a projecting part contains large bundles which are the type of collateral. Their upper side is flat to slightly convex and their lower side is convex.

Leaf anatomical characteristics such as the number of vascular bundles present on the midrib are used for classification. For example in Central Anatolia we find some taxa of *Salvia* with one large vascular bundle in the midrib of the leaves (with one or two small ones on the sides) like *S. blepharochlaena*, *S. euphratica*, *S. eriophora*, *S. sclarea*, *S. virgata*, and *S. divaricata* (Figure 3. 14a). In contrast some have two sets of vascular bundles like in *S. halophila* as described by Kaya (2008) or 3 smaller ones like: *S. viridis* and *S. verticillata* (Figure 3. 14b).

**Figure 3.14.** Leaf cross section of *S. divaricata* (a) and *S. verticillata* (b). vb vascular bundle, ad adaxial epidermis, ab abaxial epidermis, c cortex, m mesophyll, ph phloem, x xylem. Bars = 50 um.

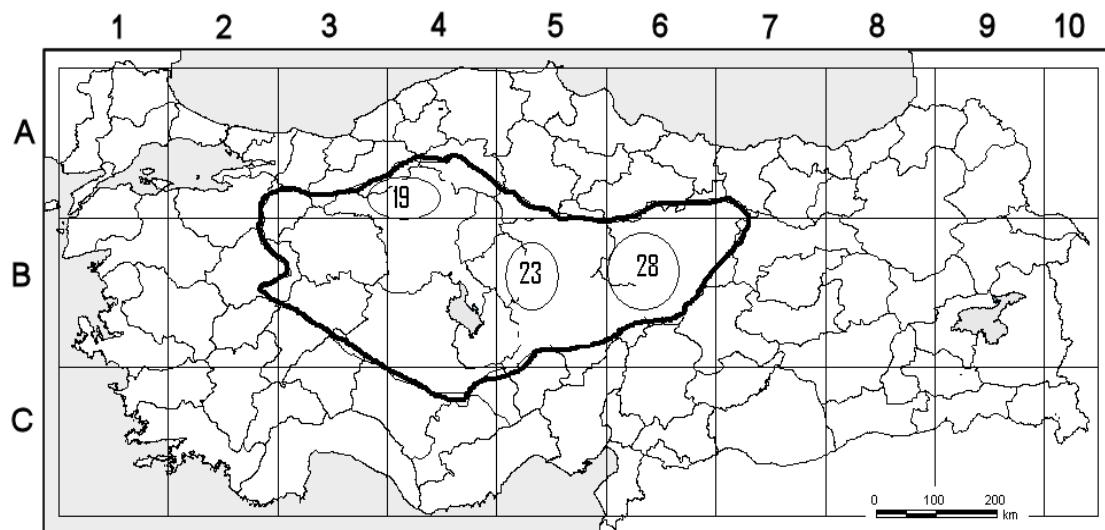

Leaf upper epidermis is another factor used in classification. In Central Anatolia there are many taxa of *Salvia* with the adaxial epidermis (ad) larger than the abaxial (ab) as in

*S. divaricata*, *S. blepharochlaena*(Özkan, 2007), *S. euphratica*, *S. aethiopis*, *S. longipedicellata*, *S. virgata*, *S. dichroantha*, *S. viridis* (Özdemir et al, 2009,) *S. halophila* (Kaya, 2008). *S. hypargeia* (Kandemir, 2003), and *Salvia tchihatcheffii* (Aktaş et al. 2009). There are taxa of *Salvia* with the adaxial and abaxial epidermis the same size with a very thin layer of cuticle such as *S. verticillata* as described by Koyuncu (2009).

### 3.3 Ecological and Phytogeographical information

#### 3.3.1 Sampling

Distributions of *Salvia* species were somewhat uneven throughout the Central Anatolia. However, most *Salvia* species prefer limestone and igneous slopes and or quercus and calcareous rocky areas. We found three major hot spots in Central Anatolia. As indicated in the map one major area is near Ankara Beypazari. The second distribution hot spot is the Kayseri-Pinarbashi area. The third hot spot is in the greater Sivas area (Map 3.1).

**Map 3.1.** The distribution of *Salvia* in Central Anatolia.

The gypseous characteristic of these three hot spots along with climatic isolation produces the conditions preferred by *Salvia*. As mentioned in the materials and methods Akpulat (2005) suggested that the reduced moisture around gypsum was advantageous to *Salvia* growth and resulted in survival of highly specialized species. Davis in The Cliff Vegetation of Eastern Mediterranean (1951) states that peculiarity of these gypseous, calcareous areas with their lower moisture content is a good foundation for endemism.

Ecological data differ from comparative data used in taxonomy. In this section instead of looking at the plant features we analyze the environmental factors such as soil, elevation and habitat. One of the most important ecological data is soil. *Salvia* is especially impacted by soil type as documented by various authors (Davis, 1951 & Akpulat, 2005). In general the bedrock preferred by *Salvia* is calcareous composite.

According to the soil analysis collected from suitable habitats for taxa of *Salvia* (Table 3.4), they generally prefer clayish soil which are slightly alkali (Ave. pH 7.83) with low organic content (Ave. 1.99%). The preferred N and CaCO<sub>3</sub> content of the soil was 0.13% and 20.71% respectively. The average amounts of P and K present were 4.82 and 151.52 ppm respectively. Salt concentration in Central Anatolia varies from 0.01 to 0.07%. The higher concentration of salt around Salt Lake (Tuz Gölü) produces a habitat in which only a limited number of plants (*S. halophila*) can adapt and survive.

In total 43 species were collected from Central Anatolia (Table 3.3), of these 26 were endemic. Therefore the rate of endemism is about 60%.

**Table 3.3.** Collected *Salvia* species indicating Flora code, Habitat and flowering time (\*indicates endemism).

Flora code		Habitat	Flowering Time
1	<i>S. divaricata</i> *	Mountain slopes, 1500-1800m	6-7
4	<i>S. tomentosa</i>	Associated with pinups on limestone and igneous 90-2000m.	4-8(9)
9	<i>S. recognita</i> *	Limestone slopes with quercus scrubs 900-2200m.	5-8
12	<i>S. bracteata</i>	Limestone slopes with quercus scrubs 50-2000m.	5-7
19	<i>S. wiedemannii</i> *	Limestone slopes 500-1400m	5-7
21	<i>S. freyniana</i> *	Limestone slopes 900-1000m	6-7
24	<i>S. tchihatcheffii</i> *	Limestone slopes with pinus brutia woodland 400-1200m.	5-6
25	<i>S. heldreichiana</i> *	Limestone slopes, 900-2000m	6-8
26	<i>S. caespitosa</i> *	Limestone and igneous slopes rocky areas 1400-2400m.	(5)6-7
29	<i>S. suffruticosa</i>	Banks of steps 300-2000m.	4-6
32	<i>S. cadmica</i> *	Limestone slopes with quercus scrubs 900-1810m.	5-7
34	<i>S. blepharochlaena</i> *	Limestone and igneous serpentine slopes 1000-1620m.	6-7
37	<i>S. euphratica</i> *	Rocky limestone slopes 850-1800m	4-5
40	<i>S. multicaulis</i>	Limestone and igneous slopes, shale and sandy slopes, amongst cedrus 550-2600m.	4-7
41	<i>S. cryptantha</i> *	Limestone and igneous slopes, dry steps, follow fields, roadsides 700-2500m.	5-7
42	<i>S. syriaca</i>	Steps, marly banks, fallow and cultivated fields 450-1850m.	4-7
43	<i>S. viridis</i>	Grassland, fallow fields 700-1150m.	3-7
44	<i>S. hypergea</i> *	Limestone and igneous slopes, fallow fields 800-2000m.	6-7
48	<i>S. eriophora</i> *	Volcanic rocky and stony slopes, alpine steppe and limestone slopes, 1525-1900 m.	6-7
50	<i>S. sclarea</i>	Limestone and igneous slopes and rocky areas, fields, roadsides 1-2000m.	5-8
52	<i>S. aethiopis</i>	Limestone and igneous slopes, fallow fields, roadsides 1-2100m.	5-8
53	<i>S. ceratophylla</i>	Limestone and igneous slopes and gypsum slopes, corn and fallow fields 300-2150m.	4-6
55	<i>S. longipedicellata</i> *	Disturbed steps, meadows and fallow fields 1620-2040m.	7-8

**Table 3.3. (Continue):** Collected *Salvia* species indicating Flora code, Habitat and flowering time (\*indicates endemism).

57	<i>S. microstegia</i>	Limestone and igneous slopes, screes, fieldsides, 970-3350m.	6-8
60	<i>S. frigida</i>	Limestone with pinus and juniperus woodlands, meadows 1000-2450m.	5-7
61	<i>S. yosgadensis*</i>	Calcareous and igneous disturbed steps 800-1400m.	5-6
62	<i>S. modesta*</i>	Rocky calcareous slopes, 1700-2000	6-7
63	<i>S. tobeyi</i>	Subalpine meadows, grassy slopes, 1400 -2100	5-6
66	<i>S. candidissima</i> <i>candidissima</i>	Calcareous rocky areas, roadsides, fallow fields 700-2000m.	5-9
67	<i>S. cyanescens*</i>	Limestone and igneous shade banks, roadsides, fallow fields 400-2300m.	6-9
68	<i>S. vermicifolia*</i>	Limestone slopes, serpentine 1450m.	6-7
76	<i>S. virgata</i>	Scrubs, meadows, roadsides, fallow fields 1-2300m.	5-9
77	<i>S. halophila*</i>	Salty and steps, 950-1000m	8-10
78	<i>S. nemorosa</i>	Rocky slopes in steps, fallow fields, sloping meadows, waste ground. 1000-2300m.	(5-)6-9
81	<i>S. dichroantha*</i>	Steps, clearing of forest, roadsides, fallow fields 800-1800m.	7-9
83	<i>S. verbenaca</i>	Scrubs, meadows, roadsides, fallow fields 1-900m.	3-5
84	<i>S. verticillata</i>	Woodland, roadsides, fallow fields 1-2300m.	6-8
85	<i>S. russellii</i>	Rocky areas, roadsides, fallow and cultivated fields 100-1600m	5-7
87	<i>S. aytachii*</i>	Steps, marly places and gypsum soils 650-870m.	5-7
89	<i>S. hedgeana*</i>	Steps, calcareous slopes 1400-1500m	
90	<i>S. anatolica*</i>	Steps, clearing of forest, calcareous slopes 1600m.	6-7
	<i>S. ekimiana*</i>	Associated with Pinus and Alpi. 1700-2100 m.	6

While there are some highly specialized *Salvia* species such as *S. caespitosa* that grow on high elevations (above 1400 m), there are many species that are found none discriminating. There seems to be a very determinate line drawn for the habitat of some species in Central Anatolia. For example *S. recognita* follows an almost assigned line from Kayseri to Ankara going through Elma Mountain and the area of Kalecik and Eldowan Mountain down to the Cobuk dam of northwestern Ankara.

After analyzing the data in the above table the resulting clusters (Figure 3.15) indicate the closeness of these species to each other in regard to soil type. In Central Anatolia some species are found generally all over. This list includes *S. cryptantha*, *S. aethiopis* and *S. syriaca*. The endemic species such as *S. cryptantha* and *S. wiedemannii* share the same soil type with *S. aethiopis* and *S. syriaca* (none endemics); however they limit themselves to Central Anatolia borders. This fact shows the effect of climate on restrictions of endemics to Central Anatolia.

**Figure 3.15.** Cluster analysis indicates the closeness of *Salvia* species to each other in regards to soil type.

### 3.3.2 Distribution range by altitude

The bulk of ecological data is often characterized by elevation. Taxa of *Salvia* in Central Anatolia are limited to elevations of about 400-3200 meters. The lowest point is near Eskisehir; a valley within Sundukan Mountains. The highest point is Mt. Ercies in Kayseri. The majority of *Salvia* taxa can be found at 1000 meters. It is worth noting that all the tree hot spots in Central Anatolia are between 900- 1100 meters.

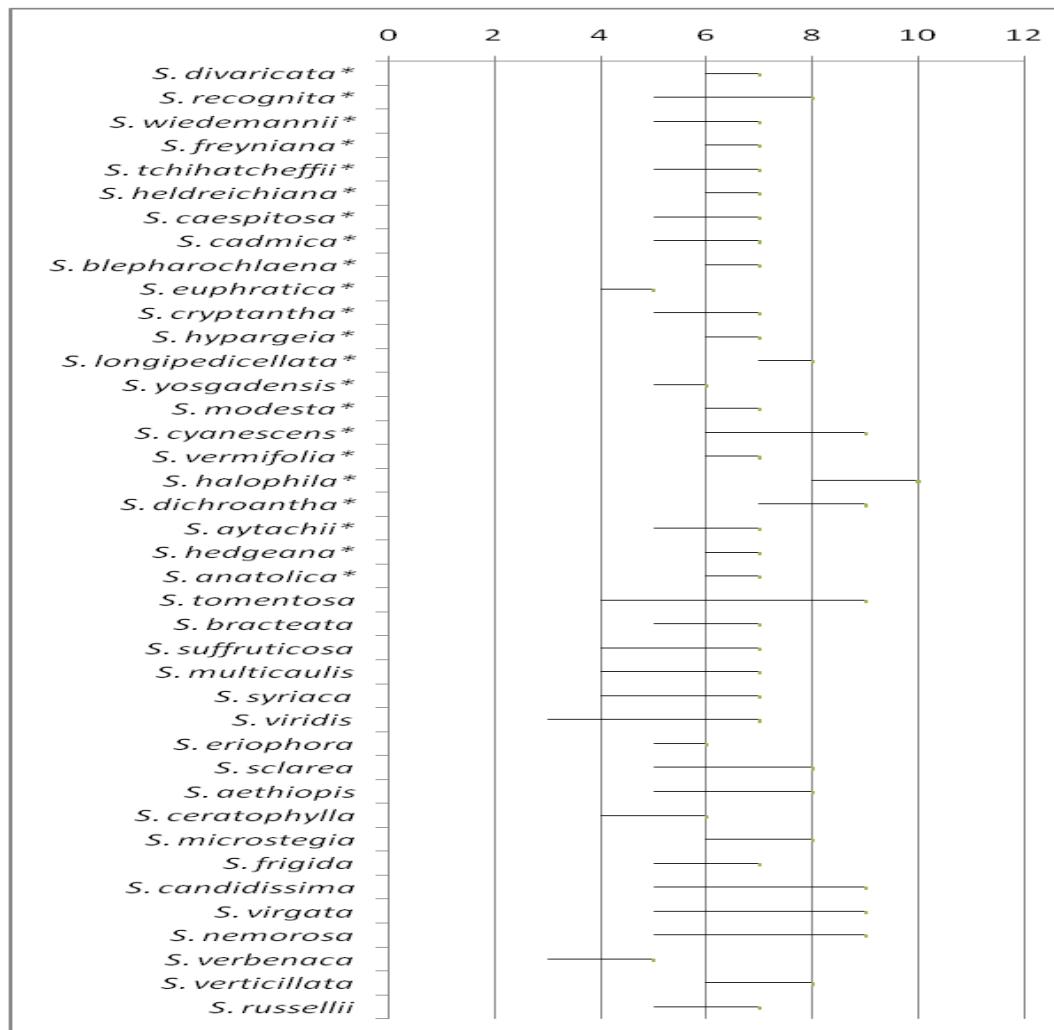

**Figure 3.16.** Altitude distribution chart for *Salvia* species of Central Anatolia.

There are very few *Salvia* found above the 2000 m level and only one above 3000 m in Central Anatolia. By observing Figure 3.16 we can deduct that many species live indiscriminate to elevation while others have a very limited preference of elevation.

### 3.3.3 Phenology

Flowering time varies greatly among taxa of *Salvia* in Central Anatolia (Figure 3.17). The taxa of *Salvia* can be seen in full bloom during the rainy season of March. *S. viridis* which prefers lower elevation and moister grassland climate is the first *Salvia* to be seen around this area. *S. halophila* ends the flowering season in October. In some areas *S. virgata* can still be seen with flower. But the majority of *Salvia* taxa are in flower during the month of June. The flowering times can however shift slightly due to climatic changes as noticed by the author during the drought peak of 2007.

**Figure 3.17.** Flowering time for *Salvia* species of Central Anatolia.

### 3.3.4 Phytogeography and Endemism

According to Davis (1965) most endemism occurs in the Central Anatolia and the Mediterranean regions of Turkey. Since Central Anatolia does not border any countries the endemics are conserved in this region. As noticed by other authors (Ekim et al, 2000), endemics were concentrated in the calcareous areas around Sivas-Gurun and Cankiri and the arid soil around Salt lake.

Anatolian endemics are numerous in the Sivas and the Beypazari areas. The rate of endemism in this area is about 60%. Of the 26 endemic species in Central Anatolia about 14 are residents of the Sivas area. Seven of the remaining 11 are found in the vicinity of Beypazari. Both of these locations are high in gypsum. Overall Central Anatolia provides a unique habitat for these endemics. Some species carry themselves all the way to the borders of Eastern Anatolia without crossing over. *Salvia cryptantha* is a good example. There are some very rare endemics in the region that are known only from one location. This list includes *Salvia vermifolia*, *Salvia freyniana* and *Salvia halophila*. These species are under threat. Davis (1971) produced the first document about the endemism in Turkey. A list of endemics and rare plants of Turkey was published by Ekim (Ekim et. al, 1989). Due to the importance of these rare plants, the threat categories of each species were determined and reported in the description of each species.

Of the three major phytogeographical regions in Turkey, all of the Central Anatolia rests in the Irano-Turanian phytogeographical region. As discussed in the materials and methods, it is well isolated by various mountains. About 60% of the *Salvia* taxa in Central Anatolia are endemic. Among the specimens collected from the area one taxon was re-discovered after 116 years (Bagherpour, 2009).

In final assessment, of the 43 *Salvia* species in Central Anatolia only 4 are from the Mediterranean origin, 2 are multi regional or from unknown origins and the remainder are Irano-turanian based (% 85.7). Endemic Central Anatolian taxa of *Salvia* consist of two CR (Critically Endangered), 7 EN (Endangered), 8 VU (Vulnerable), and 9 NT (Near Threatened).

## **CHAPTER 4**

### **REVISION OF THE GENUS *SALVIA* L. (LABIATAE) IN CENTRAL ANATOLIA, TURKEY**

#### **4.1 Infrageneric Grouping**

Boissier (1879), in his *Flora Orientalis*, recognized 107 species of *Salvia*; some of which were either described or recorded from Turkey. For the first time, he placed these species under seven sections, which had been all recognized previously by Bentham (1833) and Dumort. These sections are as follows: *Eusphace*, *Hymenosphace*, *Drymosphace*, *Aethiopsis*, *Plethiosphace*, *Horminum* and *Hemisphace*. Section *Eusphace* Benth. Later designated as the type section of the genus *Salvia* (Hedge, 1972, Reales et al., 2004). However the section *Drymosphace* is not found in Central Anatolia.

In Flora of Turkey Vol.7, concerning the genus *Salvia*, no infrageneric grouping was made. Therefore, as an initial part of the revisional study conducted on this genus since 2005 an infrageneric grouping is done. Towards achieving this goal, multivariate analysis was carried out in order to elucidate the sectional delimitation as well as understand taxonomic relationships in the genus.

Following is a list of characters chosen and their possible status value:

**Table 4.1.** Morphological characters screened for the numerical taxonomic analysis.

No	Character	Scoring
<b>HABITAT OF SPECIES</b>		
1.	Limestone soil	0
	Calcareous rocks	1
	Serpentine rocks	2
<b>FORMATION TYPES</b>		
2.	Perennial	0
	Annual	1
3.	Plant erect	0
	Plant caespitose	1
	Plant mat-forming	2
	Plant ascending	3
	Plant procumbent	4
4.	Shrubby	0
	Suffruticose	1
	Herbaceous	2
<b>STEM CHARACTERISTICS</b>		
5.	Stem with capitate glandular hair	0
	Stem without capitate glandular hair	1
6.	Stem branched above	0
	Stem branched below	1
	Stem unbranched	2
7.	Stem indumentum with mostly antrose hairs	0
	Stem indumentum with mostly retrorse hairs	1
	Stem with spreading hairs	2
	Others	3
8.	Stem glabrous, glaucous	0
	Stem pilose	1
	Stem villous	2
	Stem scabridulous	3
	Stem arachnoid	4
	Stem pubescent	5
	Stem tomentosa	6
<b>BRACT CHARACTERISTICS</b>		
9.	Bracts or floral leaves equal or shorter than calyx	0
	Bracts or floral leaves longer than calyx	1
10.	Bracts linear	0
	Bracts lanceolate	1

**Table 4.1. (Continue):** Morphological characters screened for the numerical taxonomic analysis.

Bracts elliptic	2
Bracts oblong	3
Bracts ovate	4
Bracts rhombic	5
Bracts absent	6
11. Bracts length (average)	(mm)
12. Bracts width (average)	(mm)
13. Bracts pink to mauve	0
Bracts green	1
Bracts absent	2
14. Bracts membranous	0
Bracts not membranous	1
Bracts absent	2
<b>FLOWER STRUCTURE</b>	
15. Inflorescence paniculate	0
Inflorescence not paniculate	1
16. Verticillasters distant	0
Verticillasters close	1
17. Verticillaster 1-2 flowered	0
Verticillaster 2-8 flowered	1
Verticillaster 8- 40 flowered	2
18. Pedicel length	(mm)
19. Calyx campanulate	0
Calyx infundibular	1
Calyx tubular	2
Calyx t tubular-campanulate	3
Calyx obtriangular	4
20. Calyx membranous in fruit	0
Calyx not membranous in fruit	1
21. Calyx not or scarcely accrescent (in fruit)	0
Calyx strongly accrescent (in fruit)	1
22. Calyx upper lip tri-dentate	0
Calyx upper lip flat	1
Calyx actinomorphic	2
Calyx upper lip one dentate	3
Calyx upper lip truncate	4

**Table 4.1. (Continue):** Morphological characters screened for the numerical taxonomic analysis.

23. Calyx length (average)	(mm)
a. Fruiting Calyx length (average)	(mm)
24. Calyx green	0
Calyx green and purplish	1
25. Calyx with capitate hair	0
Calyx without capitate hair	1
26. Calyx teeth spinulose	0
Calyx teeth acute	1
Calyx teeth acuminate	2
Calyx teeth obtuse	3
Calyx teeth absent	4
27. Corolla more than 20 mm	0
Corolla less than 20 mm	1
28. Corolla lilac	0
Corolla blue	1
Corolla red	2
Corolla yellow	3
Corolla white	4
Corolla mauve-pink	5
29. Upper lip of corolla same color	0
Upper lip of corolla different color	1
30. Lower lip of corolla spotted	0
Lower lip of corolla unspotted	1
31. Upper lip of corolla narrowed at base	0
Upper lip of corolla not narrowed at base	1
32. Corolla squamulate	0
Corolla non-squamulate	1
33. Corolla tube gradually wider towards throat	0
Corolla tube ventricose	1
34. Corolla upper lip strait	0
Corolla upper lip falcate	1
35. Corolla tube annulate	0
Corolla tube non-annulate	1
36. Petioles ciliate with long white eglandular hairs	0
Petioles without ciliate hairs	1
37. Stamen type A	0

**Table 4.1. (Continue):** Morphological characters screened for the numerical taxonomic analysis.

	Stamen type C	2
38.	Stamens included upper lip of corolla	0
	Stamen clearly exceeding upper lip of corolla	1
<b>LEAF CHARACTERISTICS</b>		
39.	Leaves pinnatisect	0
	Leaves lyrate	1
	Leaves undivided	2
40.	Terminal leaflet broad	0
	Terminal leaflet linear-oblong	1
	Simple, terminal leaflet absent	2
41.	Leaves linear	0
	Leaves lanceolate	1
	Leaves elliptic	2
	Leaves oblong	3
	Leaves ovate	4
	Leaves orbicular	5
	Leaves obovate	6
42.	Leaves petiolate	0
	Leaves sessile	1
43.	Leaf length (average)	(mm)
44.	Leaf width (average)	(mm)
45.	Leaf indumentum of unbranched hairs, or absent	0
	Leaf indumentum of dendroid to dendroid-stellate	1
	Leaf indumentum absent	2
46.	Leaf indumentum with gland or glandular hair	0
	Leaf indumentum without gland or glandular hair	1
47.	Leaves not fleshy	0
	Leaves fleshy	1
<b>NUTLET AND POLLEN CHARACTERISTICS</b>		
48.	Nutlets suborbicular	0
	Nutlets ovoid	1
	Nutlets trigonous	2
49.	Nutlet length	(mm)
50.	Nutlet width	(mm)
51.	Pollen polar length	(um)
52.	Pollen equatorial length	(um)

The morphometric analysis was carried out by measuring 53 morphological characters, selected according to two criteria: (a) their common use for taxonomic identification in this section; (b) the variability among different taxa. The compiled data from each OTU analysis was inserted into the MVSP program for cluster analysis. Using Gover's general similarity index (Gover, 1971) which is applicable to both continuous and discontinuous data, and the unweighted pair-group method using arithmetic averages the following cluster emerged. As a result of the analysis, we obtained the dendograms shown in Figure 4.1, in which we can distinguish six major clusters. In these clusters, we find all those sections that were determined by Bentham. Of the seven sections determined by Bentham, Section *Drymosphace* Benth. is not found within Central Anatolia. The cut-off line across the phenogram at 0.76- 0.80 similarity level distinguishes the species.

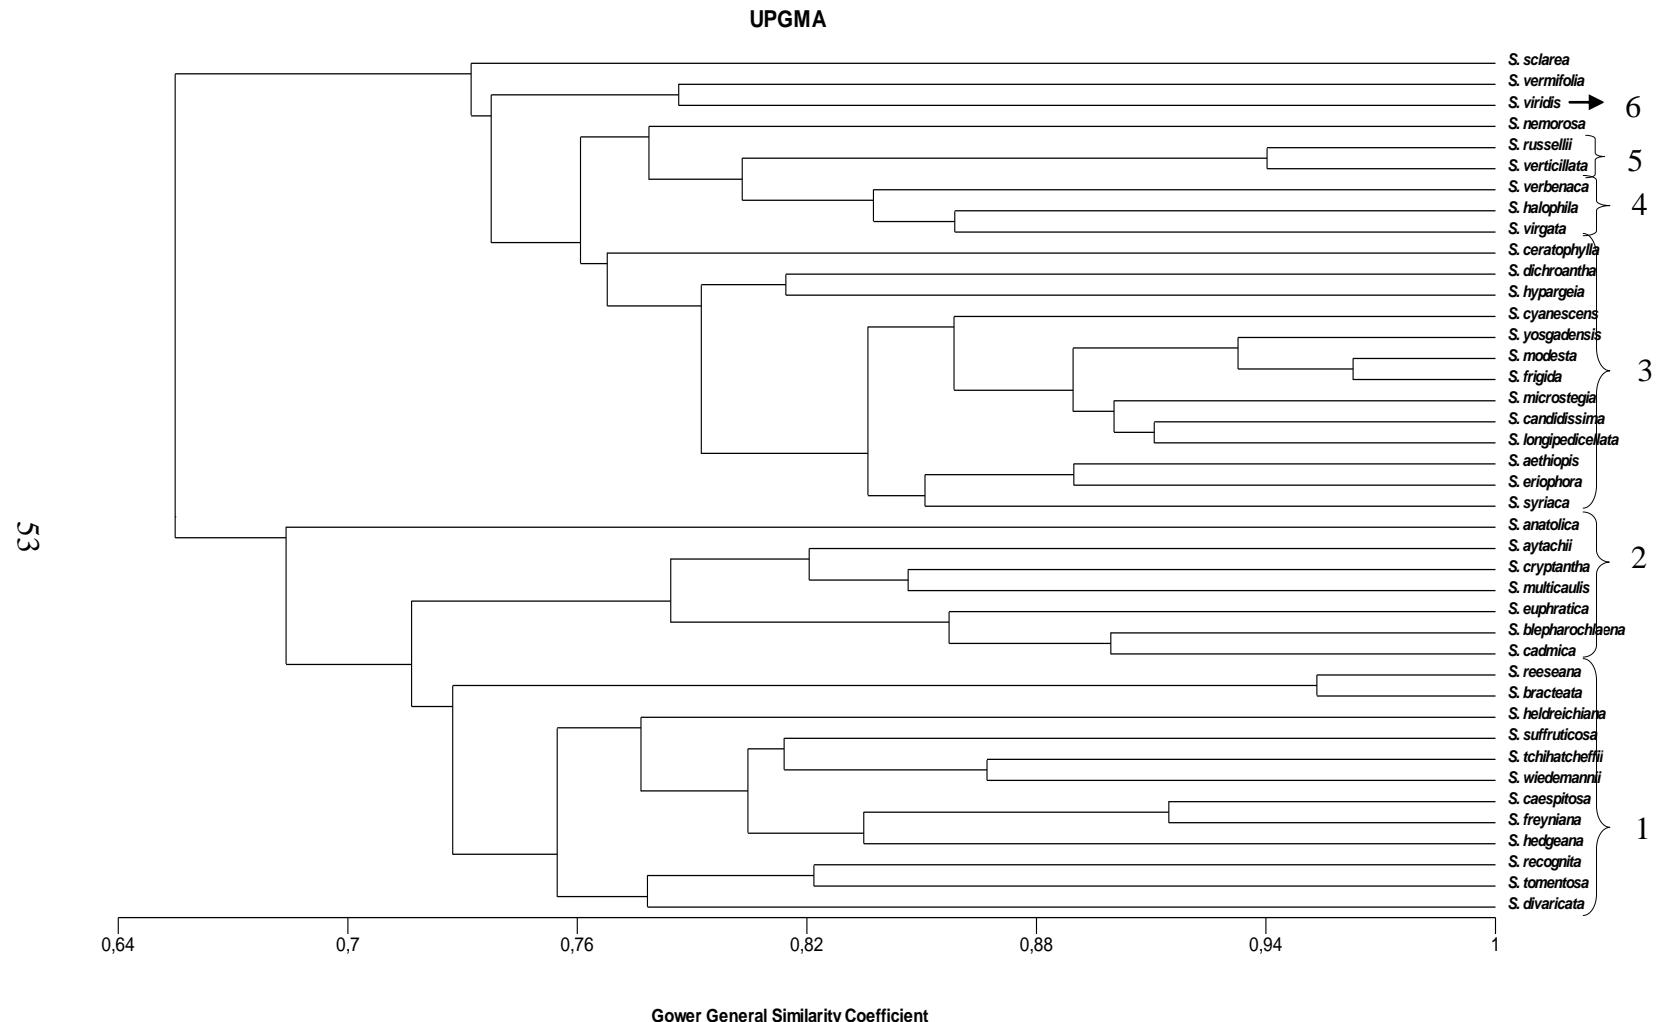

**Table 4.2.** Averaged measurement results of morphological characters in Table 3. 6.

We found remarkable variation in the characters among two sections Section *Hymenosphace*, *Salvia* and the other four sections found in Central Anatolia. While these two sections are very similar their separation from other four sections is very distinct. The Section *Hymenosphace* and *Salvia* are similar in the upper lip of corolla, more or less straight and tube hairy-ringed inside.

Sect. *Aethiopis* is the largest section of the Central Anatolian *Salvia* taxa and is similar with Section *Plethiosphace*. These two sections are similarly perennial, rarely annual herbs. Calyx campanulate; upper lip concave. Upper lip of corolla straight or falcate; tube not hairy-ringed. Also similar to Section *Hemisphace*. The section Horminum with one species separates itself from all others by being annual.

A description of all species and subspecies studied are recorded, including distribution according to the collected specimens. We found some species like *S. sclarea* and *S. vermifolia* placed close to *S. viridis* while they belong to section *Aethiopis*. *S. nemorosa* and *S. dichroantha* which both belong to section *Plethiosphace* were found outside this group. The distribution of the characters and their values among the six clusters shows how these characters behave and how helpful they are for a taxonomic differentiation of the groups studied.

**Figure 4.1.** The cluster analysis dendrogram showing the six sections of *Salvia*: *Salvia* (1), *Hymenosphace* (2), *Aethiopsis* (3), *Plethiosphace* (4), *Hemisphace* (5) and *Horminum* (6) as determined by Bentham.

Finally the analysis of matrices representing similarities and dissimilarities among taxonomic units and their ordering into taxa based on their affinity has been greatly simplified by the use of computers. The following table represents the actual similarity among species as we see them in the field. The cluster analysis resulted in separation of highly correlated species. As observed the closest species *S. frigida* and *S. modesta* are similar species at 0.963. *Salvia bracteata* and *reeseana* are practically same with only a hair difference. Additionally the table indicates many other species with high affinity to each other on the remaining nodes in the cluster:

**Table 4.3.** Cluster analysis results.

#### **4.1.1 General features of the Genus, *Salvia***

*Salvia* is one of the largest member of the Labiate family. Herbaceous or shrubs, often aromatic form numerous glands: stems square, leaves opposite, usually simple, flowers irregular (zygomorphic), in distant lateral clusters (verticillasters) which often form whorls around the stem numbering from (1) 2-10(50): calyx with 5 teeth, and 2-lipped corolla, the lower lip 3-lobed and the upper lip 2. Stamens 2 and fruit consisting of 4 nutlets hidden at the base of the persistent calyx. While one *Salvia* is annual, majority of *Salvia* taxa are perannual and the remainder biannual.

#### **4.1.2 Sectional key**

1. Annuals	<b>Sect. <i>Horminum</i></b>
1. Biennials or Perennials	
2. Corolla tube annulate (hairy-ringed inside)	
3. Connective longer than filament and not articulated with it, arms unequal, the sterile arm shorter, subulate	<b>Sect. <i>Hemisphace</i></b>
3. Connective as long as filament or shorter; arms subequal, the anterior ending in a more or less sterile cell	
4. Calyx membranous and strongly accrescent in fruit	<b>Sect. <i>Hymenosphace</i></b>
4. Calyx not membranous and not strongly accrescent in fruit	<b>Sect. <i>Salvia</i></b>
2. Corolla tube not annulate (not hairy-ringed inside)	
5. Calyx campanulate, upper lip concave and 2-sulcate in fruit	<b>Sect. <i>Plethiosphace</i></b>
5. Calyx tubular or campanulate, upper lip is not concave and not 2-sulcate in fruit.	
	<b>Sect. <i>Aethiopis</i></b>

#### **4.1.3 Species key**

1. Annual; purple sterile bracts present on the stem apex.	<b>43. <i>viridis</i></b>
1. Biennials or Perennials; no colored sterile bracts present on the stem apex.	
2. Fruiting Calyx membranous; infundibular shape, strongly accrescent with rounded lobes.	
3. Leaves pinnatisect; long eglandular ciliate indumentum present on the petioles.	
4 . Pinnate leaves terminal segment linear-oblong, pinnate leaf with 3-5 lateral segments.	<b>14. <i>blepharochlaena</i></b>
4 . Pinnate leaves terminal segment broadly oblong, pinnate leaf (simple) with 1-2 lateral segments.	<b>19. <i anatolica<="" i=""></i></b>
3. Leaves simple (seldom 1-2 lateral lobes present); long ciliate indumentum absent on the petioles.	
5. Mat-forming; lower part of stem woody, fruiting calyx up to 35 mm long.	<b>15. <i>euphratica</i></b>
5. Herbaceous plants with woody rootstock; fruiting calyx up to 28 mm long.	
6 . Corolla 27-33 mm; stem glandular pilose or eglandular villous.	<b>13. <i>cadmica</i></b>

6. Corolla 15-22 mm; stem eglandular branched or dendroid hairs.  
 7. Calyx generally green colored; stem branched with dendroid hairs.  
**17. cryptantha**  
 7. Calyx generally purple; stem glabrous, glandular or dendroid hairs.  
 8. Corolla 10-18 mm; pedicel 1-5 mm.  
**16. multicaulis**  
 8. Corolla 23-25 mm; pedicel 6-7 mm.  
**18. aytachii**
2. Fruiting Calyx non-membranous, thick textured, tubular to infundibular, with acute lobes.  
 9. Stamen connective equal or shorter than filaments; upper theca larger than the poorly developed lower theca, lower theca bears at least some fertile pollen. (Stamen type A); corolla with upper lip straight and corolla tube annulate.  
**1. divaricata**  
 10. Leaves simple or lyrate or pinnatifid  
 11. Leaves mostly basal; flowering stem up to 35 cm long, stem bellow with glandular hairs.  
**13. cadmica**  
 11. Leaves distributed over stem; flowering stem 100-120 cm long; eglandular bellow.  
**2. tomentosa**
10. Leaves pinnatisect or trisect  
 12. Leaves terminal segment broadly oblong to ovate; petioles usually without prominently ciliate hairs.  
 13. Bracts or floral leaves clearly longer than calyces.  
 14. Stems indumentum entirely eglandular.  
**12. reeseana**  
 14. Stems with or without long spreading eglandular hairs (seldom glandular).  
**11. bracteata**
13. Bracts or floral leaves equal or shorter than calyces.  
 15. Stems below glabrous.  
**19. anatolica**  
 15. Stems glandular-villous below and above.  
**3. recognita**
12. Leaves terminal segment ± linear-oblong or shortly obovate-cuneate; petioles often prominently ciliate with long white eglandular hairs.  
 16. Corolla yellow or yellowish-white.  
**9. suffruticosa**  
 16. Corolla pink or white, violet to blue colored.  
 17. Dwarf mat-forming sub shrubs.  
 18. Leaves trifoliate or trisect  
**4. hedgeana**  
 18. Leaves pinnatisect with 2-4 pair lateral segment.  
**6. caespitosa**
17. Taller growing ascending or erect sub shrubs.  
 19. Inflorescence clearly condensed ± ovoid or oblong spike.  
 20. Stems eglandular above and below; corolla 10-15 mm  
**8. tchihatcheffii**  
 20. Stems capitate glandular above; corolla (20) 25-30 mm  
**10. heldreichiana**
19. Inflorescence of distant or approximating verticillasters.  
 21. Indumentum scabridulous.  
**7. wiedemannii**  
 21. Indumentum softly pilose.  
**5. freyniana**
9. Stamen connective clearly longer, lower theca reduced to a usually dolabriform plate of tissue, corolla with upper lip falcate and corolla tube usually not annulate (Stamen type B).  
 22. Upper lip of corolla straight (not falcate), corolla tube annulate; verticillasters 8-40 flowered; lower theca subulate (Stamen type C)  
 22. Leaves linear-oblong; calyx teeth not mucronate.  
**42. russellii**  
 22. Leaves oblong to ovate; calyx teeth mucronate.  
**41. verticillata**
22. Upper lip of corolla slightly falcate, corolla tube not annulate; verticillasters 2-8 flowered; lower theca is reduced and generally dolabriform (Stamen type B).  
 23. Corolla more than 20 mm.  
 24. Corolla tube not squamulate, ventricose or not.  
**32. hypargeia**  
 24. Corolla tube squamulate, ventricose.  
 25. Upper lip of corolla lilac.  
 26. Bracts clearly longer than calyx.  
**35. sclarea**  
 26. Bracts scarcely longer than calyx.  
**31. cyanescens**

25. Upper lip of corolla white.
27. Leaves linear, linear-lanceolate or linear-oblong
27. Leaves oblong, ovate to orbicular.
28. Calyx short papillose or glandular pilose hairs; inflorescence ± slender
34. *vermifolia*
28. Calyx with long spreading capitate glandular hairs; inflorescence ± sturdy
25. *candidissima*
23. Corolla less than 20 mm.
29. Flowers lilac or violet or pinkish
30. Corolla tube squamulate.
31. Inflorescence axis, bracts and calyxes ± dark violet blue; calyx teeth subulate; stems eglandular
21. *eriophora*
31. Inflorescence axis, bracts and calyxes ± green; calyx teeth acuminate; glandular or not.
31. *cyanescens*
32. Stems above and below eglandular-pilose
30. *yosgadensis*
32. Stems above glandular-pilose to villous
33. Corolla 16-20 mm; Leaves pilose to lanate beneath; calyx teeth short spinulose.
31. *cyanescens*
33. Corolla shorter than 16 mm; leaves arachnoid to sublanate beneath; calyx teeth long spinulose.
34. Corolla 12-16 mm, generally white; bracts 8-12 x 7-11 mm
27. *frigida*
34. Corolla 8-11 mm, generally purple; bracts 6-18 x 6-8 mm
28. *modesta*
30. Corolla tube not squamulate.
35. Bracts strongly colored violet to blue or purple.
36. Inflorescence axis, bracts and calyxes ± dark violet blue; calyx teeth subulate; stems eglandular
21. *eriophora*
36. Inflorescence axis, bracts and calyxes green; stems glandular or not.
39. *nemorosa*
35. Bracts green or lightly tinged purple.
38. Leaves oblong
39. Stems eglandular above and below; leaves crenulate.
36. *dichroantha*
39. Stems glandular above; leaves pinnatifid to subentire
40. *verbenaca*
38. Leaves ovate-oblong to broadly ovate.
40. Leaves ± fleshy, margins subentire (saline habitats).
38. *halophila*
40. Leaves not fleshy, margins subentire to erose to pinnatifid (non-saline habitats).
41. Calyx 5-7 mm; stems usually less than 30 cm.
40. *verbenaca*
41. Calyx 6-10 mm; stems 30-100 cm.
37. *virgata*
29. Flowers white, yellow or cream
42. Leaves pinnatifid with spreading linear segments; biennial; corolla generally sulphur yellow, with upper lip rarely lilac.
33. *ceratophylla*
42. Leaves not pinnatifid; perennial, rarely biennial.
43. Inflorescence candlebriform; stems eglandular lanate; perennial or biennial.
44. Leaves ovate-elliptic-oblong, 10-31 x 5-9 cm, leaf margins erose; Upper lip of corolla 7-9 mm
22. *aethiopis*
44. Leaves oblong (seldom ovate-oblong), 2.5-7.5 x 1-2.5 cm, crenulate serrulate, upper lip of corolla 3.5-4.2 mm
23. *ekimiana*
43. Inflorescence not candlebriform; stems pilose or villous; perennials.
45. Pedicels 7-12 mm
24. *longipedicellata*
45. Pedicels shorter than 5 mm.
46. Leaves ovate, cordate, serrulate; corolla c. 10 mm
20. *syriaca*
46. Leaves oblong to broadly ovate or orbicular, cordate, cuneate, margins crenulate to erose; corolla 8-20 mm
47. Upper lip of calyx bisulcate in flower, clearly so in fruit and recurved.
37. *virgata*
47. Upper lip of calyx not bisulcate and not recurved in fruit.

48. Leaves ± densely lanate.  
     49. Corolla 17-20 mm; upper lip strongly falcate  
         **26. microstegia**  
     49. Corolla 7-11 mm, upper somewhat falcate. **23. ekimiana**
48. Leaves not lanate.  
     50. Stem eglandular above and below; calyxes' eglandular.  
         **39. yosgadensis**  
     50. Stem glandular above; calyces glandular.  
         51. Inflorescence rascence with vilose hair  
             **29. tobeyi**  
         51. Inflorescence without vilose hair  
             52. Corolla 8-11 mm, purple; bracts 6-18 x 6-7.5 mm **28. modesta**  
             52. Corolla 12-16 mm, white or lilac; bracts 8-12 x 7-11 mm.  
                 **27. frigida**

## 4.2 Species descriptions

### 4.2.1 Section *Salvia Hedge* (Sect. *Euphace* Benth.):

Shrubs or perennial herbs. Calyx generally not accrescent or only slightly so. Upper lip of corolla more or less straight; tube hairy-ringed inside. Connective as long as filament or shorter; arms subequal, the anterior ending in a more or less sterile cell.

Species for Sect. *Salvia Hedge*:

- 1. *S. divaricata*** Montbret & Aucher ex Bentham in Ann. Sci. Nat. ser. 2, 6:37 (1836).  
     Syn: *S. trigonocatyx* Woronow in Monit. Jard. Bot. Tiflis 22:10 (1912).

Perennial herb with woody rootstock. **Stems** 30-60 cm, erect, branched above, green to purplish, shortly eglandular (sometimes glandular retrose pilose) with some sessile glands below, glabrous above. **Leaves** mostly basal, simple, rarely with a pair of small lateral lobes, narrowly oblong, (2-) 3-8 (-9) x 0.8-2.5 cm, upper surface sparsely eglandular pilose and beneath densely tomentose with sessile glands, rugose, crenulate. **Petiole** 1-5 (-7) cm, ciliate. **Inflorescence** an elongate, widely branched panicle. **Verticillasters** 2-4(-6)-flowered, clearly distant. **Bracts and bracteoles** absent. **Pedicels** 10-35 mm, glabrous, rigid, erecto-patent. **Calyx** tubular-campanulate, 12-18 mm, slightly longer in fruit, fruiting calyx thick-textured, often purplish, densely glandular pilose and sometimes a few eglandular villous hairs; upper lip obsoletely tridentate, acuminate. **Corolla** pink or lilac, 25-35 mm; tube straight below, widening above, 15-25

mm, incompletely annulate; upper lip  $\pm$  straight. **Stamens A.** **Styles** 27-37 mm. **Nutlets** c. 4-5 x 3-3.5 mm, black. Chromosome count: 2n=14.

The **pollen** of *S. divaricata* is isopolar and prolate with  $P = 50.87 \pm 7.08 \mu\text{m}$  and  $E = 46.76 \pm 5.30 \mu\text{m}$ . The aperture is hexocolpate and the colpi =  $44.55 \pm 6.84 \times 3.43 \pm 0.93 \mu\text{m}$ . The exine is  $1.12 \pm 0.12 \mu\text{m}$  thick and the intine is  $0.50 \pm 0.03 \mu\text{m}$ . Its ornamentation is reticulate.

*Fl: 6-7, limestone slopes and mountain slopes, 1030-1870 m.*

**Type Specimen:** [Turkey B7] in Cappadocia Orientalis [ad Euphratem], Aucher [1528]

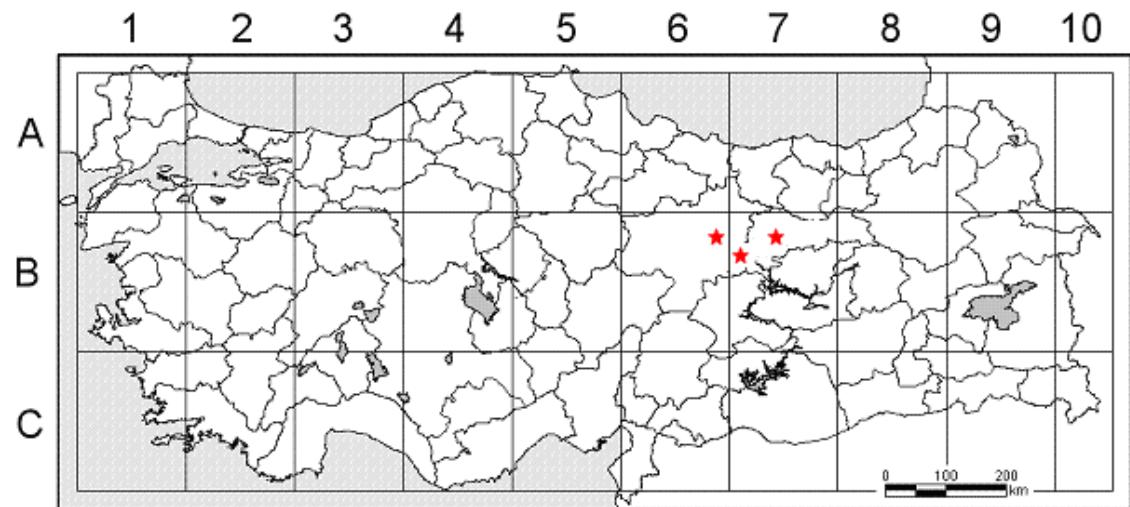

**Mainly E. Anatolia. A8 Çorum:** Gorgotachan, S. of Artvin, 19 vii 1911, Woronow 920 (type of *S. trigonocatyx*) (E! K!). B6 Sivas: Sivas-Zara-Divriği road, N. of 26 km, 11 vii 2006, GAkaydin 10994! B7 Sivas: 26 km from Divriği to Kemaliye, 39 31 14 N 38 09 40 E, 1535 m, 9 vii 2006, AKahraman1260! Erzincan: Çilhoraz Mountain, 39 35 30 N 38 44 09 E, 1870 m, 9 vii 2006, AKahraman1267! **Endemic. Ir.-Tur. element.** Threat category: **NT**

*S. divaricata* is distantly related to *S. aucheri* on account of the habit and the stem indumentum, but very distinct in terms of the narrowly oblong mostly basal leaves, the wide-branching glabrous panicles and the very long pedicels.

**Figure 4.2.** General appearance of *S. divaricata* Montbret & Aucher ex Bentham.

**Map 4.1.** *S. divaricata* distribution map.

**2. *S. tomentosa*** Miller, Gard. Dict. ed. 8, no. 2 (1768). Syn: *S. grandiflora* Etl., *Salvia* 17 (1777); *S. grandiflora* Etl. subsp. *aegaea* (Bornm.) Rech. fil. in Bot. Jahrb. 69:501 (1939); *S. grandiflora* Etl. subsp. *rotundifolia* (Vis.) Rech. fil., Fl. Aeg. 519 (1943). Ic: Jacq., Eclog. PI. Rar. 1: t. 36 (1811-16).

Perennial Clump-forming suffruticose herb. **Stems** to 1 m, stiffly erect, quadrangular, often branched above, eglandular-tomentose with sessile glands (rarely with capitate glandular hairs above). **Leaves** simple, narrowly oblong to ovate, 0.8-11 x 0.5-6 cm, rounded to cordate at base (rarely with small basal lobules), entire to crenulate; **petiole** 0.8-6.0 cm. **Inflorescence** branched. **Verticillasters** 4-10 flowered, distant or condensed above. **Bracts** broadly ovate, 3-20 x 2-11 mm, deciduous; **bracteoles** present. **Pedicels** 2-10 mm. **Calyx** ± tubular, 7-16 mm, accrescent to 11-18 mm in fruit, usually violet, pilose to villous, with or without capitate glandular hairs; upper lip shortly tridentate. **Corolla** lilac to purple, or white, c. 21-30 mm; tube straight, 18-22 mm, incompletely annulate; upper lip straight. **Stamens** A. **Nutlets** rounded trigonous, ± spherical, 3.5 x 3.2 mm. Chromosome count:  $2n = 14, 15,$  and 16.

The **pollen** of *S. tomentosa* is isopolar and oblate with  $P = 38.62 \pm 3.29 \mu\text{m}$  and  $E = 44.73 \pm 3.61 \mu\text{m}$ . The aperture is hexocolpate and the colpi =  $32.63 \pm 3.80 \times 4.72 \pm 0.43 \mu\text{m}$ . The exine is  $1.16 \pm 0.14 \mu\text{m}$  thick and the intine is  $0.72 \pm 0.10 \mu\text{m}$ . Its ornamentation is reticulate.

*Fl. 4-8(-9). Often associated with Pinus brutia and P. nigra, Quercus pubescens, in macchie, on limestone or igneous slopes, 90-2000 m.*

Described from cultivated material, Miller (holo. BM!).

**Endemic. Ir.-Tur. element.** Treat category: **VU**

Characterized by the stem indumentum and large corollas. In the same broad alliance as *S. pilifera*, *S. pinnata* and *S. tigrina*, but clearly differing from them in several features.

**Figure 4.4.** General appearance of *S. recognita* Fisch. & Mey.

**Map 4.3.** *S. recognita* distribution map.

**4. *S. hedgeana*** Dönmez sp. nov., Bot. J. Linn. Soc. 137: 413-416 (2001).

Dwarf perennial suffruticose herb. **Stems** 5-10 (-15) cm, procumbent, ascending, branched at base, with sterile shoots, retrorsely pilose hairs with sessile glands on stem and inflorescence. **Leaves** trifoliate, lanceolate in outline, with one pair of lateral segments, lateral segments (4-) 6-9 (-11) x 1-2 mm, terminal leaf segment lanceolate, 20-30 (-40) x 3-5 mm, margin entire, slightly involute. **Petiole** 10-20 mm, winged, ciliate. **Inflorescence** racemose, (3-) 5-8 x 2-3 cm, slightly exceeding the leaf level with (3-) 4-5 (-6) verticillasters. **Verticillasters** 2-4 (-6)-flowered. Floral leaves similar to stem leaves. **Bracts** clearly shorter than calyces, lanceolate at base, 8-15 x 2-3 mm, lower bracts up to 40 mm; bracteoles present, lanceolate, (4-) 6-10 (-13) x 1-2 (-4) mm. **Pedicels** 5-9 mm. **Calyx** campanulate, 10-15 mm, up to 17 mm in fruit, (13-) 14 (-15) veined, retrorsely pilose, with sessile glands, violet mainly on upper half, bilabiate, lobes divided to nearly mid length, lower lobe with two teeth, broadly lanceolate, 6-8 mm, upper lobe with small three teeth, triangular 1-2 mm. **Corolla** 15-20 mm, blue, with white spot on lower lip, sparsely villous outside, densely long hairs on outside of upper lip; tube 8-14 mm, non-squamulate, with an annulus in throat; upper lip falcate. **Stamens** A, included upper lip of corolla, staminal connectives shorter than filaments; filaments c. 5 mm, upper thecae 3.5 mm, lower thecae 1-1.2 mm. **Style** 30-35 mm, exerted from corolla lips. **Nutlets** oblong to ovoid, 2.5-4 x 2-2.5 mm, dull green, entire to slightly papillate. Chromosome count: unknown.

The **pollen** of *S. hedgeana* is isopolar and oblate with  $P = 46.24 \pm 3.81 \mu\text{m}$  and  $E = 49.30 \pm 3.45 \mu\text{m}$ . The aperture is hexocolpate and the colpi =  $38.97 \pm 3.57 \times 5.54 \pm 1.30 \mu\text{m}$ . The exine is  $1.62 \pm 0.21 \mu\text{m}$  thick and the intine is  $0.55 \pm 0.06 \mu\text{m}$ . Its ornamentation is bireticulate.

**5. *S. freyniana*** Bornm. in Öst. Bot. Zeitschr. 42: 349, 375 (1892).

Perennial suffruticose herb with a woody rootstock. **Stems** many, ascending to erect, 15-35 cm, unbranched (rarely branched), grayish-green, dense eglandular antrorsely pilose-pubescent with some villous hairy. **Leaves** pinnatisect with 1-2 pairs of lateral segments, terminal segments linear-oblong, 1.5-5 x 0.3-1 cm, grayish-green, densely eglandular-pubescent to pilose with sessile glands, margins entire to crenulate toward apex, petiole 0.4-2.5 cm, slightly widened at base, dense antrorsely pubescent to pilose with long ciliate hairy. **Inflorescence** racemose, clearly exceeding leaves with 3-6 verticillasters, each **verticillaster** with 2-8 flowered ± distant. **Bracts** ovate to lanceolate, dense white capitate glandular pilose, 4-10 x 2-5 mm. **Bracteoles** present. Pedicel 2-5 mm. **Calyx** campanulate, c. 7 mm to c. 11 mm in fruit, eglandular and glandular villous. Corolla lilac-blue with white center, 10-18 mm, tube 10-13 mm straight, annulate upper lip straight. **Stamens** A, staminal connectives shorter than filaments, upper theca 1.9-2.7 mm, the lower theca 1-1.3 mm, filaments c. 2.7-3.2 mm. **Style** glabrous, 16-20 mm long, exerted from corolla lips and divided in two part at apex. **Nutlets** rounded-trigonous and suboblate, dark brown, c. 3.15 - 4 x 2.5 - 3 mm, surface slightly tuberculate. Chromosome count: Unknown.

The pollen of *S. freyniana* is isopolar and oblate-spheroidal to prolate-spheroidal with  $P = 42.10 \pm 8.87 \mu\text{m}$  and  $E = 39.17 \pm 6.61 \mu\text{m}$ . The aperture is hexocolpate and the colpi are long  $C = 37.38 \pm 7.59 \times 4.28 \pm 0.85 \mu\text{m}$ . The exine is  $1.02 \pm 0.09 \mu\text{m}$  thick and the intine is  $0.62 \pm 0.09 \mu\text{m}$ . Its ornamentation is bireticulate.

Fl. 6. *Dry sandy calcareous slopes 1082m.*

Type: [Turkey B5 Kayseri/Yozgat] inter Caesaream (Kayseri) et Yosgad (inter pagos Köprüköi et Keller), 900-1100 m, 23 vi 1890, Bornmüller 1730 (iso. BM! G! K! LD! W! Z!).

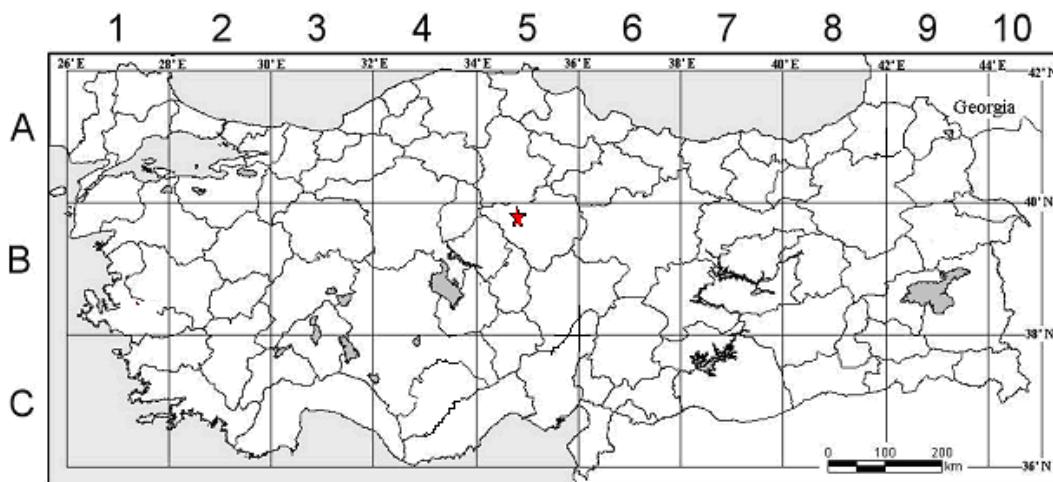

The first specimens belonging to *S. freyniana* Bornm. were collected by J.F.N. Bornmüller from Yozgat B5 near Köprüköi et Keller in 1890 and than described as a new species in 1892. Near yenipazari at the village of Kaşkışla on sandy hillsides above the village cemetery, 39 30 553 N 35 06 970 E, 1082 m, 04 vi 2006, SBagherpour 277.

Endemic. Ir.-Tur. element. A rather problematical species, known only from one location (CR). Apparently closest to *S. wiedemannii* but differing by softer indumentum, larger sometimes serrulate terminal leaflet and campanulate calyx.

**Endemic. Ir.-Tur. element.** Treat category: **CR**

**Figure 4.6.** General appearance of *S. freyniana* Bornm.

Vindob. 4 (1851) nom. nud.; *S. brevispicata* Davis in Kew Bull. 6:96 (1951)!

Perennial shrub **stems** much branched, 25-50 cm, to 1.5 m. Young shoots ± erect, leafy, pilose and villous with some sessile glands below, short hairs ± retrorse, glandular-pilose to -villous above with capitate glandular hairs. **Leaves** trisect, terminal segment much larger than laterals, broadly elliptic to obovate, 1-2.6 (-3) x 0.5-1.8 cm, glabrous, pubescent and villous with numerous sessile glands to glabrescent, serrulate to crenulate; **petiole** 0.4-1.8 cm, long ciliate. **Inflorescence** ca. 5-10 cm long. **Verticillasters** 2-6-flowered, forming an ovoid or elongated oblong spike. Bracts ovate-acuminate, often tinged reddish-purple, c. 20-35 x 7-12 mm; **bracteoles** present. **Pedicels** 1-4 mm. **Calyx** ± tubular infundibular, 14-17 mm, scarcely accrescent to 16-20 mm in fruit, often purplish, glandular-ciliate, bilabiate, upper lip tridentate, ovate-lanceolate, acute to acuminate, median tooth shorter. **Corolla** blue-purple, (20-) 25-35 mm; tube straight and gradually wider towards throat c. 20 mm, not squamulate, annulate. **Stamens** A. Anther 3-4 mm, upper theca ca. 3 mm, lower theca ca. 1 mm, filaments ca.

5-6 mm. **Nutlets** rounded, oblong, c. 4 x 3 mm, brown. Chromosome count:  $2n = 14, 15, 16$ .

The **pollen** of *S. heldreichiana* is isopolar and oblate with  $P = 49, 61\pm 1, 83$   $\mu\text{m}$  and  $E = 52, 39\pm 4, 74 \mu\text{m}$ . The aperture is hexocolpate and the colpi = 41,  $16\pm 1, 74 \times 4, 08\pm 0, 52 \mu\text{m}$ . The exine is  $0, 81\pm 0, 08 \mu\text{m}$  thick and the intine is  $0, 68\pm 0, 08 \mu\text{m}$ . Its ornamentation is bireticulate.

*Fl. 6-8. Limestone slopes, with Pinus nigra and Quercus, screes, fieldsides, 900-2000 m.*

FL .6. Igneous and calcareous slopes, fieldsides, 700-1400 m.

Type: [Turkey A6 Tokat] 15 km N Tokat, gegen Artova, c. 1400 m, 14.vi.1939, H.Reese (holo. Hb. Hub.-Mor.) (G-00000038) photo!

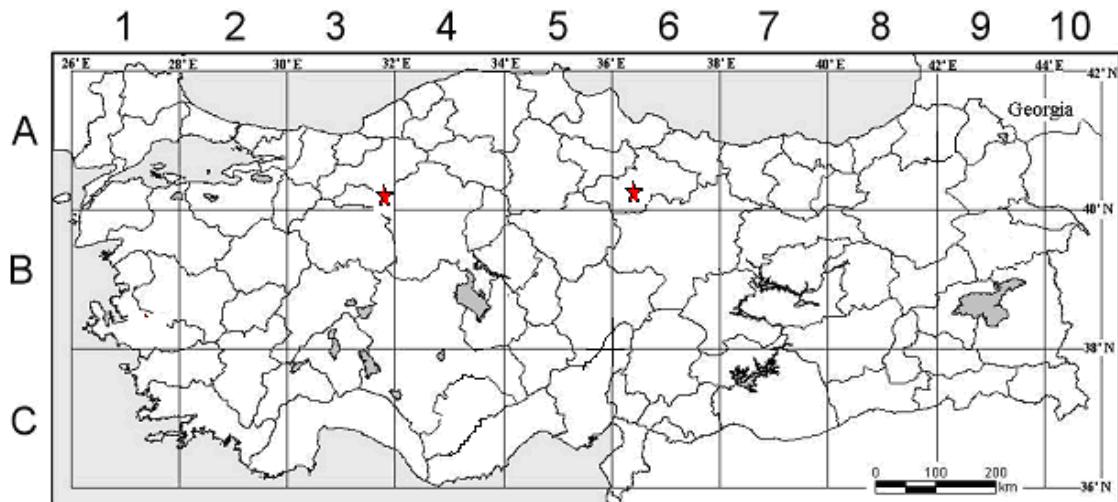

**Central Anatolia.** A3 Ankara: Beypazari, Elma beli, 700 m, Yamane 957 (ANK)!

**Endemic. Irano-Turanian element.** Treat category: EN

This species is known only from these two localities. Similar to *S. bracteata* in facies, vegetative and floral structure but differing by the indumentum which consists entirely of short crisp eglandular hairs ± uniform in length. During the last three years field work this specimen was not found.

**Figure 4.13.** General appearance of *S. reeseana* Hedge & Hub.-Morath holotype (Huber-Morath Herbarium)

**Map 4.12.** *S. reeseana* distribution map.

#### 4.2.2 Section *Hymenosphace* Benth.:

Shrubs, chamaephytes or perennial herbs. Calyx strongly accrescent. Otherwise similar to Sect. *Salvia*.

Species for Sect. *Hymenosphace*:

#### 13. *S. cadmica* Boiss.

SYNONYM: *S. conradi* Stapf in Denkschr. Akad. Wiss. Wien, Math.-Nat. Kl. 50(2): 97 (1855)., *S. cadmica* Boiss. var. *brachycalcycina* Bornm. in Beih. Bot. Centr. 24(2): 487 (1909).

Perennial herb with a woody rootstock. **Stems** few or many, ascending to erect, usually unbranched or rarely branched, (8) 20- 35 cm, densely (or not) glandular pilose and eglandular villous. **Leaves** mostly basal, ovate, ovate-oblong to elliptic, obovate, simple or with 1-2 pairs of small lateral segments, 10-50 x 5-35 mm, rugulose, crenulate, densely (or not) eglandular villose and glandular pilose with sessile glands; petiole 1.0 – 5 (6) cm. **Inflorescence** racemose, (7) 10-30 cm long, clearly exceeding leaves with 4 – 8 (9) verticillasters, each verticillasters with 2–10 (12) flowered; internodes 1.5 – 4 cm long. **Bracts** broadly ovate - acuminate, 1.0 – 2.1 x 1.4 – 2 cm, green, villose and glandular pilose hairy with sessile glands. **Pedicels** 2-4 mm. Calyx campanulate, 12 – 20

mm, up to 28 mm in fruit, mainly green (or rarely purplish green), eglandular-glandular villose and glandular pillose with sessile glands, broadening and membranous with increasingly divergent lips in fruit; upper lip subentire. Corolla entirely white (with yellow spotted lower lip), 27 – 33 mm, sparsely villose and glandular hairy outside, not squamulate; tube 17 – 25 mm, straight below, gradually widening above, annulate. **Stamens** type A; staminal connectives shorter than filaments; upper theca 2-3 mm; the lower theca 1.5 – 3 mm; connective 4 – 6 mm. Style tip white, glabrous, 25 – 32 mm, long exerted from corolla lips and divided in two part at apex. Nutlets globose, 3-3.5 x 2-3.2 mm, brown and smooth to slightly tuberculate. Chromosome count:  $2n=14$ , 16.

The **pollen** of *S. cadmica* is isopolar and oblate with  $P = 49.36 \pm 3.99 \mu\text{m}$  and  $E = 51.44 \pm 3.82 \mu\text{m}$ . The aperture is hexocolpate and the colpi =  $44.14 \pm 3.92 \times 8.20 \pm 0.64 \mu\text{m}$ . The exine is  $1.34 \pm .12 \mu\text{m}$  thick and the intine is  $0.62 \pm 0.01 \mu\text{m}$ . Its ornamentation is bireticulate.

**16. *S. multicaulis*** Vahl, Enum. PI. 1:225 (1805). Syn: *S. acetabulosa* Vahl, op. cit.227 (1805) non L. (1767) excl. syn.; *S. szovitsiana* Bunge, Lab. Pers. 43 (1873); Schraderia 'acetabulosa' (Vahl) Pobed. in Fl. URSS 21:369 (1954); *Arischrada multicaulis* (vahl) Pobed. in Novit. Syst. PI. Vasc (Leningrad)·9:247 (1972). Ic: Fl. URSS 21: t. 18 f. 1 (1954), as Schraderia acetabulosa.

Perennial herb, mat-forming, with a woody rootstock. **Stems** erect, unbranched, 12-55, cm, usually glandular-pilose to -villous, especially above, rarely glabrous, rarely with dendroid hairs. **Leaves** simple, mostly with 1-2-pairs of small basal lobes, broadly ovate-elliptic to suborbicular, 2-4.5(-7) x 1-4.7 cm, rugose, crenulate, with a dense indumentum of ± adpressed dendroid to dendroid-stellate hairs; petiole 1.5-6.5 cm. **Verticillasters** 4-10(~20)-flowered, usually-distant. Bracts broadly ovate, c. 4 x 25 mm; **bracteoles** present. **Pedicels** 1-5 mm, erecto-patent. **Calyx** campanulate, c. 8-27 mm, to C. 32 mm in fruit and broadening, sparsely to densely glandular-pilose or -villous, purplish-violet, rarely yellow-green; upper lip indistinctly 3-lobed. **Corolla** purplish-violet, rarely white, c. 10-18 mm; tube ± straight, c. 12 mm, annulate, not squamulate ; upper lip ± straight. **Stamens A.** **Nutlets** rounded trigonous, 3.5 x 3 mm, dark brown. Chromosome count:  $2n = 16, 18, 32$ .

The **pollen** of *S. multicaulis* is isopolar and prolate-spheroidal with  $P = 41.34 \pm 7.81 \mu\text{m}$  and  $E = 39.53 \pm 5.41 \mu\text{m}$ . The aperture is hexocolpate and the colpi =  $36.00 \pm 6.90 \times 4.58 \pm 1.15 \mu\text{m}$ . The exine is  $1.10 \pm 0.15 \mu\text{m}$  thick and the intine is  $0.68 \pm 0.13 \mu\text{m}$ . Its ornamentation is bireticulate.

*Fl. 4-7. Rocky limestone and igneous slopes, shale and sandy slopes, scree, fallow fields, in Quercus scrub, Artemisia steppe, amongst Cedrus, 550-2600 m.*

A less variable species than its close relative *S. muhicaulis* and generally more western in it's distribution. In areas where they overlap, e.g. Sivas and Nigde, they appear to retain their identity and no hybrids have been seen. *S. cryptantha* is also closely related to the Lebanese and Syrian species *S. pinardii* Boiss. which is glabrous above and has pale bluish flowers. Two anomalous gatherings from A3 Ankara, Beypazari (Akman 1005, 1102!) may be hybrids (*S. aytachii*). In inflorescence, calyx and corolla characters they are atypical for *S. cryptantha* and have some features of *S. tomentosa*; the indumentum is typically that of the former species.

**Endemic. Ir.-Tur. element.** Treat category **NT**

**Figure 4.19.** General appearance of *S. cryptantha* Montbret & Aucher ex Bentham.

**Map 44.17.** *S. cryptantha* distribution map.

**18. *S. aytachii*** Vural. In Tr. J. of Botany 20: 531-534 (1996)

Caespitose perennial herb with a woody rootstock. **Stems** ascending-erect, unbranched, 20-50 cm, glabrous above, sparsely simple and dendroid hairs below. **Leaves** mostly clustered at base of flowering shoots, grayish, simple, ovate-elliptic to suborbicular, rounded at base, 1-4.5 x 0.5-1.5 (-1.7) cm, rugose, crenulate, with dense

dendroid hairs; **petiole** 1-3 (-4.4) cm. with dense dendroid hairs and long ciliate on margins. **Verticillasters** 4-8 (-10) flowered, clearly distant. **Bracts** green, broadly ovate, 6-15 x 5-10 mm, sparsely simple and glandular hairy; bracteoles linear to oblong, membranous, 1-3 mm. **Pedicels** 2-7 mm, with spreading and retrorse hairs, rarely glabrous. **Calyx** purplish-violet to yellowish-green, campanulate, 6-20 mm, to 22 mm in fruit and broadening with a indumentum of sparse long simple eglandular and short glandular hairs, with sparse sessile glands; upper lip indistinctly 3-lobed or subentire. **Corolla** whitish-pink, 14-32 mm; tube straight, annulate, c. 16 mm; upper lip ± straight. **Stamens** A; staminal connectives shorter than filaments; upper theca larger than the lower theca, 3 mm; lower theca 1.2 mm; filament 5 mm; connective c. 7 mm. Style glabrous below, sparsely soft, minute hairs towards apex, 22 m. **Nutlets** dark brown, ovoid, smooth, 4 x 3 mm. Chromosome count: unknown.

The **pollen** of *S. aytachii* is isopolar and oblate with  $P = 37.68 \pm 4.89 \mu\text{m}$  and  $E = 41.19 \pm 4.02 \mu\text{m}$ . The aperture is hexocolpate and the colpi =  $33.55 \pm 5.14 \times 5.50 \pm 1.01 \mu\text{m}$ . The exine is  $1.50 \pm 0.13 \mu\text{m}$  thick and the intine is  $0.56 \pm 0.08 \mu\text{m}$ . Its ornamentation is bireticulate.

A distinctive, oligomorphic species, recognised by the tidy habit, regularly ovate leaves and the small white corollas.

W. Syria, Soviet Armenia, N. Iraq, Syrian Desert, Iran, **Ir.-Tur. element**. Treat category **LC**

**Figure 4.22.** General appearance of *S. syriaca* L.

**Map 4.20.** *S. syriaca* distribution map.

**21. *S. eriophora* Boiss. & Kotschy in Boiss., Fl. Or. 4:611 (1879).**

Perennial herb. **Stems** 10-20 cm in flower, to 40 cm in fruit, several from a woody rootstock, erect, widely branched above, eglandular lanate-arachnoid. **Leaves** simple, mostly basal, linear-oblong, (2-5) 3-6 (-6.5) x 0.6-1.3 cm, narrowing into a (10-) 15-25 mm petiole, arachnoid, rugose, crenulate. **Inflorescence** 5-25 mm, paniculate with stiffly erecto-patent branches, arachnoid-lanate, violet-blue. **Verticillasters** 2-6-flowered, approximating (slightly distant in fruit). **Bracts** usually almost equal to calyces, broadly ovate, 9 - 12 x 6 - 8 mm, arachnoid-lanate. **Pedicels** 2-3 mm, erect. **Calyx** tubular-campanulate, 8-11 mm, to 12-13 mm in fruit, violet, arachnoid-lanate, teeth long-subulate, c. 2 mm. **Corolla** violet-blue, 8-13 mm; tube 4-8 mm, straight, glabrous within; upper lip ± straight, lower lip unspotted. **Stamens** B. **Nutlets** usually brown, c. 3 x 2 mm. Chromosome count: unknown.

The **pollen** of *S. eriophora* is isopolar and oblate-spherical with P = 44.53 ± 5.17 µm and E = 48.78 ± 5.92 µm. The aperture is hexocolpate and the colpi = 39.24 ± 5.33 x 4.87 ± 0.39 µm. The exine is 1.09 ± 0.09 µm thick and the intine is 0.46 ± 0.06 µm. Its ornamentation is bireticulate.

*Fl:* 6-7, volcanic rocky and stony slopes, alpine steppe and limestone slopes, 1525-1900 m.

**Type Specimen:** [Turkey C5 Adana/Niğde] ab Jool Baatch (Yol Bahçe) ad radices montis Allahdag (Ala Da.) Ciliciae, 1525 m, [3 vi 1859], Kotschy 229 (G iso. BM! W!.K)

**C. & S. Europe, Caucasia, Crimea, Iran. Introduced in N. America.** Threat category: **LC**

**Figure 4.24.** General appearance of *S. aethiopis* L.

**Map 44.22.** *S. aethiopis* distribution map.

**23. *S. ekimiana* F.Celep & Doğan sp. nova**

Type: Turkey. Central Anatolia, B5 Yozgat: Above Akdağmadeni, Aktaş region, 39°35' 157 N 35°50' 014 E, 1793 m, open *Pinus sylvestris* forest and alpine steppe, 16 VI 2007 F.Celep 1214 (holotype ANK; isotypes E, K, GAZI).

Perennial herbs with a woody rootstock at base. Stems ascending to erect, 10-30 (-40) cm, branched or not, densely eglandular lanata. Leaves mostly basal, mainly oblong (ovate to oblong or oblanceolate) c. 2.5-7 x 1-2.5 cm, greyish-green, densely eglandular lanate, rugose, margins crenulate to serrate, petiole up to (10) 15-30 (-45) mm. Inflorescence widely branched, candelabrum-like, densely eglandular lanate. Verticillasters 4-12, each verticillaster with 4-10 flowered, internodes 0.5-2 cm. Bracts broadly ovate, 0.3-1.5 x 0.2-1.2 cm, densely lanate. Pedicels 2-3 mm. Calyx tubular to campanulate, 7-11 mm, up to 13 mm in fruit, scarcely expanding in fruit, densely eglandular lanate hairy, teeth shortly spinulose 0.7-0.8 mm. Corolla white with lilac hood, 7-11 mm, squamulate; tube 4-7 mm, upper lip c. 3.5-4.2 mm, scarcely falcate. Stamens 2, type B; staminal connectives clearly longer than filaments. Style glabrous, 8-12 mm, long exerted from corolla lips and divided in two part at apex. Nutlets rounded-trigonous, 2.7-2.9 x 2.2-2.5 mm, greenish to brown and surface slightly tuberculate. Chromosome count: unknown.

Pollen grains are hexocolpate, oblate spheroidal to prolate-spheroidal and its ornamentation is suprareticulate. The polar axis ( $39.2 \pm 5 \mu\text{m}$ ) is bigger than the equatorial axis ( $34.4 \pm 5 \mu\text{m}$ ), P/E: 0.97-1.14 and the colpi are long  $31.7 \pm 5 \mu\text{m}$ . The exine is ( $0.95 \pm 0.12 \mu\text{m}$ ) slightly thicker than the intine ( $0.75 \pm 0.20 \mu\text{m}$ ).

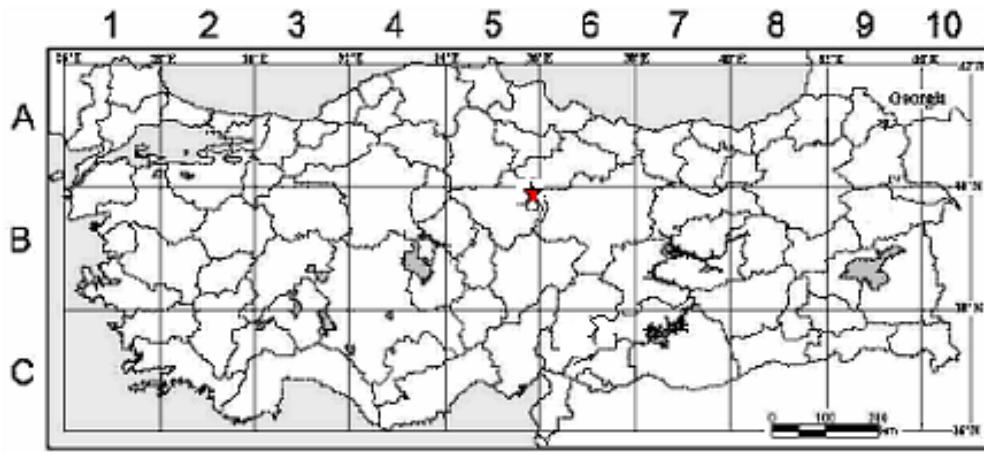

*Fl. 6. Associated with Pinus. 1700-2100 m.*

Distribution of species: Greece, Albania. Ir.-Tur. element? A widespread and common species throughout most of Inner Anatolia. The two subspecies — one eastern, one western - recognised here are based largely on leaf shape and indumentum; their extremes are quite distinct but there are many intermediates. Within them there are also numerous rather distinctive local populations, but these do not merit formal status.

**Map 4.25.** *S. candidissima* subsp. *candidissima* (★), and *S. candidissima* subsp. *occidentalis* (■) distribution map.

**26. *S. microstegia*** Boiss. & Bal. (Figure 10) Boiss., Diagn. ser. 2(4):17 (1859). = *S. verbascifolia* Bieb. var. *cana* Boiss., Fl. Or. 4:619 (1879)! = *S. chnoodes* Stapf in Denkschr. Akad. Wiss. Wien, Math.-Nat. Kl. 50:98(1885)! Ic: J. Roy. Hort. Soc. 85(10): t. 140(1960).

Perennial herb with a woody rootstock, **Stems** few or several, erect, 20-100 cm, densely pilose-villous glandular, often eglandular lanate below. **Leaves** mostly basal, variable in size and shape, ovate to oblong, (5-)7-17(-20) x 3-8(-14) cm, white or grey lanate, obtusely lobed or irregularly serrate, sub-cordate; petiole 3-16(-20) cm. **Inflorescence** usually a widely spreading panicle, often yellowish-green. **Verticillasters** 4-6-flowered, usually distant. **Bracts** variable, broadly ovate, 9-17 x 8-14 mm. **Pedicels** 2-5 mm. **Calyx** ± campanulate, 9-12 mm, to c. 11-14 mm in fruit, densely glandular with capitate glandular hairs and sessile glands; upper lip shortly tridentate, median tooth much shorter; lips ± equal. **Corolla** white, lip fading yellow, 17-30 mm, tube 5-8 mm, ventricose, squamulate; upper lip compressed, strongly falcate. **Stamens** B. **Nutlets** ovoid, c. 3 x 2.5 mm. Chromosome count:  $2n = 16$ .

The **pollen** of *S. microstegia* is isopolar and oblate with  $P = 46,96 \pm 1,34 \mu\text{m}$  and  $E = 52,49 \pm 2,88 \mu\text{m}$ . The aperture is hexocolpate and the colpi =  $37,05 \pm 1,76 \times 4,56 \pm 0,8 \mu\text{m}$ . The exine is  $0,69 \pm 0,07 \mu\text{m}$  thick and the intine is  $0,63 \pm 0,13 \mu\text{m}$ . Its ornamentation is bireticulate.

Related to *S. xanthocheila*, *S. atropatana* and *S. argentea* (q.v.); also close to the Caucasian *S. verbascifolia* M.Bieb. which apparently always differs by its much thinner indumentum on all parts. *S. microstegia* varies considerably in the density of the leaf indumentum; the most lanate specimens are usually from the higher altitudes. Although in most cases there is little likelihood of confusion with *S. argentea*, despite the narrow morphological differences, some specimens from S. Anatolia (e.g. C4, C5) are close to the latter.

Latakia, Lebanon. **Irano-Turanian element.** Threat category: **LC**

Close to *S. modesta* and *S. yosgadensis*. With some affinities to *S. argentea* and *S. microstegia* but with much smaller corollas. A most variable species in all respects. Although there is a core of specimens which is fairly typical for the species, there are many individuals which because of characters of habit, indumentum, leaf shape, bract size and calyx shape are anomalous. Mostly they occur in the northern peripheral parts of the range (e.g. A4, B2, B3). Male sterile sex-forms are very common and these plants tend to be aberrant in other respects. No definite hybrids have been reported but D. 19915 (B6 Maraş; d. Goksun, Yalak, 1400 m) combines features of *S. frigida* (calyx and corolla) and *S. microstegia* (height and indumentum) and is not readily assignable to either.

**30. *S. yosgadensis*** Freyn & Bornm. in Ost. Bot. Zeitschr. 42:348 (1892). Map 54.

Perennial herb. Stems 13-40 cm, usually stiffly erect, quadrangular, densely eglandular-pilose above with some sessile glands (rarely with some capitate glandular hairs). Leaves mostly basal, ovate to oblong, 2.7-13 x 1-6 cm, rugulose, pubescent with many sessile glands, irregularly serrate to erose; petiole 1-5 cm. Inflorescence widely paniculate. Verticillasters 4-6-flowered, ± distant. Bracts ovate, 5-15 x 4-14 mm. Pedicels 2-3 mm. Calyx infundibular, 7-11 mm, c. up to 15 mm in fruit and widening, eglandular pubescent with many sessile glands, teeth clearly spinulose. Corolla white or tinged lilac, 7-14 mm; tube c. 7 mm, ventricose, squamulate; upper lip narrow, scarcely falcate, scarcely bifid. Stamens B. Nutlet, rounded-trigonous c. 2.95 x 2.3. Chromosome count:  $2n=20$

The **pollen** of *S. yosgadensis* is isopolar and oblate with  $P = 35.61 \pm 1.71 \mu\text{m}$  and  $E = 39.13 \pm 1.77 \mu\text{m}$ . The aperture is hexocolpate and the colpi =  $29.60 \pm 1.38 \times 5.57 \pm 0.36 \mu\text{m}$ . The exine is  $1.29 \pm 0.07 \mu\text{m}$  thick and the intine is  $0.70 \pm 0.07 \mu\text{m}$ . Its ornamentation is bireticulate.

*Fl. 5-6. In Quercus scrub, disturbed steppe, fields, 800-1400 m.*

Distinctive on account of its habit and the large coloured bracts, often exceeding the flowers; a fairly oligomorphic species. Hedge (in Rechinger, Fl. Iranica 150: 452. 1982) indicated the inadequate 42.45 (LINN) as the type, but Rosúa & Blanca argued that this collection conflicted with Linnaeus' protologue (and was also identifiable as *S. argentea* L. 1762). They therefore designated Burser material, from Italy, as the lectotype.

**Throughout most of Europe, S.W. & C. Asia.** Threat category: LC

**Figure 4.388.** General appearance of *S. sclarea* L.

Perennial usually coarse herb. **Stems** erect, (10-)30-100 cm, much branched above or not, indumentum variable, pilose to tomentose, glandular or eglandular. **Leaves** simple, distributed over stem or rarely restricted to basal rosettes, ovate-oblong to broadly ovate, 3.7-30 x 2-15 cm, eglandular-pilose with numerous sessile glands, cordate, rugulose, erose, crenate; serrate to subentire; **petiole** 1-15 cm. Inflorescence a widely branched panicle with long ± slender secondary branches; **verticillasters** 2-6-flowered, distant, rarely condensed. Bracts ovate-acuminate, 2-10 x 2-9mm. **Pedicels** 1-3 mm. **Calyx** ± tubular campanulate, 5-10 mm, to 10-12 mm in fruit with a strongly recurved bisulcate upper lip, glandular or eglandular pilose. **Corolla** violet-blue to lilac, rarely white, 12-20 mm; tube 7-9 mm, ventricose, not squamulate; upper lip falcate. Stamens B. Nutlets rounded trigonous, ovoid, 2.5 x 2 mm. Chromosome count:  $2n = 16$ .

The **pollen** of *S. virgata* is isopolar and oblate with  $P = 36.20 \pm 1.51 \mu\text{m}$  and  $E = 42.30 \pm 3.58 \mu\text{m}$ . The aperture is hexocolpate and the colpi =  $29.75 \pm 1.08 \times 3.71 \pm 0.33 \mu\text{m}$ . The exine is  $1.28 \pm 0.31 \mu\text{m}$  thick and the intine is  $0.62 \pm 0.06 \mu\text{m}$ . Its ornamentation is bireticulate.

An overall review of this widespread species together with the narrow splits off it (such as *S. tesquicola* Klokov & Pobed., *S. deserta* Schang and *S. pseudosylvestris* Stapf) is needed, but the characters used (mostly of indumentum) to recognise these segregate species scarcely justify specific separation. Not very common in Central Anatolia, mostly an Eastern Anatolia species.

**C. Europe, Balkans, S. & C. Russia, Crimea, Caucasia, Iran, Afghanistan and Persia.** Treat category LC

**Figure 4.412.** General appearance of *S. nemorosa*.

**Map 44.40.** *S. nemorosa* distribution map.

**40. *S. verbenaca*** L. Species Plantarum page 25 no. 13 (1753) Afzal-Rafii, Z. in Bull. Soc. Bot. Fr. 126, Lettres Bot. 1979, 1: 79-86 (1979). = *S. clandestina* L., Sp. Bulgaria, Caucasia, Iran, N. Iraq. **Irano-Turanian element.** By far the commoner subspecies in Anatolia. Treat category **LC**

**Figure 4.434.** General appearance of *S. verticillata* subsp. *amasiaca*.

**Map 44.402.** *S. verticillata* subsp. *amasiaca* distribution map.

**42. *S. russellii*** Benth. In DC., Prodr. 12:357 (1848)

Perennial herb. **Stems** 20-60 cm, erect, usually simple, many, arising from a woody rootstock, eglandular-pubescent. **Leaves** simple, linear-oblong, sometimes sublyrate or deeply lobed at base, 5-8 x c. 1 cm, rugulose, cuneate, eglandular-pilose especially on veins and with numerous sessile glands; petiole 2-8(-10) cm. **Verticillasters** 20-30-flowered, clearly distant. **Bracts** c. 6 x 2 mm, ovate-acuminate. **Pedicels** 2-6 mm, erecto-patent. **Calyx** tubular, c. 6 mm, purplish-blue, eglandular spreading pilose and with sessile glands, ovate in fruit with a concave-bisulcate upper lip, teeth not mucronate. **Corolla** violet-blue, c. 10 mm, tube straight with an inverted V-shaped annulus; upper lip straight, compressed, narrowed at base. **Stamens** C. **Nutlets** ovate, 2.5 x 1.5 mm. Chromosome count: Unknown.

The **pollen** of *S. russellii* is isopolar and prolate with  $P = 28.42 \pm 0.87 \mu\text{m}$  and  $E = 30.72 \pm 1.00 \mu\text{m}$ . The aperture is hexocolpate and the colpi =  $23.95 \pm 0.99 \times 3.67 \pm 0.80 \mu\text{m}$ . The exine is  $1.03 \pm 0.11 \mu\text{m}$  thick and the intine is  $0.59 \pm 0.08 \mu\text{m}$ . Its ornamentation is bireticulate.

*Fl:* 5-7, Rocky slopes, grassy meadows amongst *Quercus*, fallow and cultivated fields, 100-1600 m.

**Type:** [Syria] prope Aleppo, *Russell* (holo. BM)

**Figure 4.445.** General appearance of *S. russellii* Bentham.

**Map 44.413.** *S. russellii* distribution map.

#### 4.2.6 Section *Horminum* (Moench) Dumort:

Annuals. Calyx tubular, deflexed in fruit. Upper lip of corolla more or less straight; tube not hairy ringed. Connective longer than filament; arms unequal, the sterile arm shorter and more or less distally.

Species for Sect. *Horminum*:

**43. *S. viridis*** L. Species plantarum, page 24, no. 7 (1753).= *S. horminum* L., Species plantarum, page 24, no. 8 (1753) Ic: Sibth. & Sm., Fl. Graeca 1: t. 19 & t. 20 (1806), as *S. horminum*; Hegi, 111. Fl. Mittel-Eur. 5(4): f. 2488, 2489 (1927).

Annual herbs. **Stems** simple or branched, 7-50 cm, erect, glandular-pilose or eglandular-pilose, with or without a coma of violet, green, pink or white sterile bracts. **Leaves** simple, oblong or ovate, c. 5x2.5 cm, regularly crenate, rounded or cordate at base, obtuse, pubescent; petiole 2-5 cm. **Verticillasters** 4-8-flowered, distant or approximating. **Bracts** broadly ovate, c. 10x10 mm; bracteoles present. **Pedicels** 2-5 mm, erect, flattened. **Calyx** tubular, 7-10 mm, to c. 12 mm in fruit and strongly deflexed, eglandular-pilose or glandular; upper lip ± truncate. **Corolla** lilac-purple to white, generally upper lip of corolla lilac-purple, lower lip of corolla white-lilac, 12-18 mm; tube straight, glabrous within; upper lip broad, ± falcate. **Stamens** B. **Nutlets** oblong-elliptic, 3 x 1.5. mm. Chromosome count:  $2n = 16$ .

The **pollen** of *S. viridis* is isopolar and prolate-spherical with  $P = 39.34 \pm 3.00 \mu\text{m}$  and  $E = 38.34 \pm 5.73 \mu\text{m}$ . The aperture is hexocolpate and the colpi =  $33.82 \pm 2.52 \times 5.13 \pm 0.85 \mu\text{m}$ . The exine is  $1.14 \pm 0.13 \mu\text{m}$  thick and the intine is  $0.58 \pm 0.07 \mu\text{m}$ . Its ornamentation is bireticulate.

The only annual species of *Salvia* in Turkey. There are several apparently distinctive forms based on coma features. In Turkey, the most frequent is that with a prominent violet coma; less frequent are those in which the coma is absent or is white, green or pink. The violet form is often called var. *horminum* (L.) Batt. & Trab.

Most of the Mediterranean area, Crimea, Cyprus, Caucasia, Iran (except C.), N. Iraq. **Medit. element.** Treat category **LC**

**Figure 4.456.** General appearance of *S. viridis* L.

**Map 44.424.** *S. viridis* distribution map.

## **CHAPTER 5**

### **CONCLUSION**

In conclusion, *Salvia* taxa were exposed to extensive morphological analysis. They were studied according to their root, stem, leaves, essential characters of flowers, and reproductive organs. This information includes indumentum characteristics, inflorescence shapes, nutlet observations and measurements all of which were recorded in the infragenic description of each *Salvia*. The data deficient descriptions were completed and stem, leaf, calyx, corolla dimensions were updated.

Anatomical section preparations of distinctive parts of the plants were observed for taxonomic evaluation. For the first time, the anatomical characteristics of *S. vermifolia* endemic to Turkey were examined in detail, and identified subsessile, capitate glandular and non-glandular trichomes on stems, leaves blades and petioles, as well as, size, shape, colour and sculpturing pattern of the nutlets were clarified (Bagherpour et al., 2010).

Pollen features of *Salvia* were studied. Statistical analysis were done on each set of data and the results were tabulated in tables 3.1 and 3.2. For the first time each species pollen data was provided in the description.

When the species were detected, the area of occupancy and distribution, populations and their size and the number of mature individuals were documented. Threat categories were re-evaluated using IUCN Red List Categories Version 3.1 (2001). In final assessment, of the 43 *Salvia* species in Central Anatolia only 4 are from the Mediterranean origin, 2 are multi regional or from unknown origins and the remainder

are Irano-turanian based (% 85.7). Endemic Central Anatolian taxa of *Salvia* consist of 2 CR (Critically Endangered), 7 EN (Endangered), 8 VU (Vulnerable), and 9 NT (Near Threatened).

Geographic locations of all *Salvia* species distributed in Central Anatolia were obtained, their habits were photographed and their phenological and distribution characteristics of were updated. For the first time, GPS coordinates and soil characteristics of each species were recorded. On a field trip conducted in Yenipazar, South of Yozgat, one taxon was re-discovered after 116 years (Bagherpour et al., 2009) and two new records *S. nemorosa* and *S. tobeyi* were found in Kayseri and Ankara, respectively.

We found three major areas of distributions of *Salvia* in Central Anatolia. These areas are: Ankara Beypazari, Kayseri- Pinarbashi and the greater Sivas area. Therefore, three areas were recommended for conservation.

According to the soil analysis collected from suitable habitats for taxa of *Salvia* (Table 3.4), they generally prefer clayish soil which are slightly alkali (Ave. pH 7.83) with low organic content (Ave. 1.99%). The preferred N and CaCO<sub>3</sub> content of the soil was 0.13% and 20.71% respectively. The average amounts of P and K present were 4.82 and 151.52 ppm respectively. Salt concentration in Central Anatolia varies from 0.01 to 0.07%. The higher concentration of salt around Salt Lake (Tuz Gölü) produces a habitat in which only a limited number of plants (*S. halophila*) can adapt and survive. Cluster analysis of relationship of *Salvia* species to soil type was graphed. The endemic species such as *S. cryptantha* and *S. wiedemannii* share the same soil type with *S. aethiopis* and *S. syriaca* (none endemics); however they limit themselves to Central Anatolia borders. This fact shows the effect of climate on restrictions of endemics to Central Anatolia.

For the first time sectional delimitation was presented to place each taxon in its proper position. This included the detailed work of character analysis, measurements, data tabulation and evaluation of all species. The presented revision is based on and ordered according to the numeric analysis of the 43 species found in the Central Anatolia. The

species key specific to Central Anatolia is presented. This work would afford future taxonomist the ability to recognize species relationship with confidence. The unique inferagenic classification is also a first for Central Anatolia.

While observing the results of cluster analysis it was noticed that *S. anatolica* indeed is not related to *S. bracteata* which belongs to section *Salvia* as described by Hamzaoglu (2005), but the numeric results placed it in section *Hymenosphace* in the same section as *S. blepharochlaena*. The habit of *S. anatolica* resembles *S. blepharochlaena* and not at all to *S. bracteata*. Therefore re-evaluation of *S. anatolica* is recommended.

Multivariate analysis has been conducted on the basis of the *S. euphratica* sensu lato (*S. cerino-pruinosa*, *S. euphratica*, *S. leiocalycina* and *S. pseudeuphratica*) and its closely related species (*S. kronenburgii* and *S. sericeo-tomentosa*) in order to understand their taxonomic status (Kahraman, Celep, Doğan, Bagherpour, 2010). In the Flora of Turkey, *S. euphratica*, *S. kronenburgii* and *S. sericeo-tomentosa* were evaluated as separate species. On the other hand, *S. cerino-pruinosa* and *S. pseudeuphratica* were regarded as synonyms of *S. euphratica*. As a result of the present study, *S. cerino-pruinosa* and *S. pseudeuphratica* are accepted as distinct species.

Finally an expanded description of each species is presented utilizing the information gathered in the field and the laboratory.

As the result of this research thirteen publications were presented.

### Education

**Masters of Science, Genetic Microbiology, Dec. 1985** . South Dakota State University, Brookings, S.D .

**Bachelors of Science, Microbiology and Chemistry, June 1983**. South Dakota State University, Brookings, S.D.

## Publications

Bagherpour S., Celep F., Doğan M., Kahraman A. (2010) *Salvia brachyantha* subsp. *tankutiana* (Lamianaceae), a new subspecies from Turkey. (under review).

Bagherpour S., Kahraman A., Doğan M., Celep F., Başer B., Pehlivan S. (2010) Anatomical and micromorphological characteristics of *Salvia vermicifolia* Hedge & Hub.-Mor. (Sect. *Aethiopis* Benth., Lamiaceae). Central European Journal of Biology (in press).

Bagherpour S., Celep F., Doğan M., Kahraman A. (2009) Rediscovery of *Salvia freyniana* Bornm. (Lamianaceae), a critically endangered species in Turkey. Bangladesh Journal of Botany 38(2): 193-195.

Bagherpour S., Kahraman A., Doğan M., Ferhat Celep. (2010) Anatomy, Tricome and Nutlet Micromorphology of *Salvia vermicifolia* Hedge & Hub.-mor. (SectT. *Aethiopis* Benth., Laminaceae) Endemic to Turkey. XIII OPTIMA March 22-26, Antalya, Turkey p. 160.

Celep F., Kahraman A., Bagherpour S., Karabacak E., Basar B., Dogan M., Akaydin G., Pehlivan S., Uysal I. (2010) Revision of the Genus *Salvia* L. (Labiateae) in Turkey. XIII OPTIMA March 22-26, Antalya, Turkey p24.

Dogan M., Celep F., Kahraman A., Bagherpour S., Karabacak E., Akaydin G. (2010) Conservation Status of Rare Endemic Species of *Salvia* L. (Lainaceae) in Turkey. International Symposium on the Biology of Rare and Endemic Plant Species (Biorare Symposium), May 26-29, Fethiye-Muğla, Turkey OP23.

Kahraman A., Dogan M., Celep F., Bagherpour S., Akaydin G. (2010) Rare Non-endemic Species of the Genus *Salvia* L. (Laminaceae) in Turkey. International Symposium on the Biology of Rare and Endemic Plant Species (Biorare Symposium), May 26-29, Fethiye-Muğla, Turkey PP26.

Kahraman A., Dogan M., Celep F., Bagherpour S. (2010) Comparative Anatomy and Trichome Morphology of some *Salvia* L. (Laminaceae) Taxa and their Systematic Significance. XIII OPTIMA March 22-26, Antalya, Turkey p. 65.

Kahraman A., Celep F., Doğan M., Bagherpour S. (2010) Nutlet morphology and its systematic implications for the genus *Salvia* L. section *Hymenosphace* Bentham (Lamiaceae) in Turkey (under review).

Özler H., Pehlivan S., Kahraman A., Başer B., Yavru A., Celep F., Bagherpour S., Doğan M. (2010) Pollen morphology of the genus *Salvia* section *Salvia* (Lamiaceae) in Turkey and its systematic significance (under review).

Kahraman A., Celep F., Doğan M., Bagherpour S. (2010) A taxonomic revision of *Salvia euphratica* sensu lato and its closely related species (sect. *Hymenosphace*, Lamiaceae) by using multivariety analysis. Turkish Journal of Botany (in press).

Celep F., Doğan M., Bagherpour S., Kahraman A. (2009) A New Variety of *Salvia sericeotomentosa* (Lamiaceae) from South Anatolia, Turkey. Novon 19 (4): 432-436.

Doğan M., Akaydin G., Celep F., Bagherpour S., Kahraman A., Karabacak, E. (2007) Infrageneric Delimitation of *Salvia* L.(Labiateae) in Turkey, International Symposium 7<sup>th</sup> Plant Life of South West Asia, 25-29 June, Eskişehir, Turkey. O-12.

Bagherpour, Safi and Gellenbeck, Kevin, Mody Dipak, Coin Molly, Vonshak Avigad & Boussiba Sammy. The design of a large scale photobioreactor for production of *Spirulina platensis*. 1st. Algae technology symposium 2001.Izmir, Turkey .

Coin, Molly; Bagherpour, Safi, and Gellenbeck, Kevin. Comparison of tube diameter and automated growth measmement of *Spirulina platensis* in a tubular photobioreactor. Phycological Society of America Annual Meeting. 2000. San Diago, California USA

Bagherpom Safi and Gellenbeck, Kevin. (1999). The interaction of flow and oxygen concentration in a tubular reactor during growth of the cyanobacterium *Spirulina platensis*. Algae and human affaires in the 21 st century, 8th International Conference on Applied Algology.. Montecatini Treme, Italy.

Bagherpour, S. and Sperrazzo, P. Comparison of *Spirulina* growth in a Tubular Bioreactor and an Open Raceway Pond. The annual meeting of the Phycological Society of America. 1998. Flag Staff, Arizona USA

Bagherpour, S. and Westby, CA. Transformation of High Ethanol Yielding *S. cerevisiae* strains with lac plasmid pBW314. The annual meeting of the American Society for Microbiology. 1985. Las Vegas, Nevada USA

## **Personal**

Citizen of the United States of America.

Fluent in English, Farcy & Turkish languages.
